NAME OF MEDICINE
COSUDEX
Bicalutamide 50 mg tablets

PRESENTATION
COSUDEX 50 mg is a white film-coated tablet containing 50 mg bicalutamide and is impressed with CDX50 on one side and a logo on the other.

INDICATIONS
Treatment of advanced prostate cancer in combination with GnRH luteinizing-hormone releasing hormone (LHRH) agonist therapy or surgical castration.

Prevention of disease flare associated with the use of LHRH agonists.

DOSAGE AND ADMINISTRATION

AS COMBINATION THERAPY IN ADULT MALES INCLUDING THE ELDERLY
One tablet (50 mg) once a day.

Treatment with COSUDEX should be started at the same time as treatment with a GnRH (LHRH) agonist or surgical castration.

CHILDREN
COSUDEX is contraindicated in children.

USE IN ADULT MALES WITH RENAL IMPAIRMENT
No dosage adjustment is necessary for patients with renal impairment.

USE IN ADULT MALES WITH HEPATIC IMPAIRMENT
No dosage adjustment is necessary for patients with mild hepatic impairment. Increased accumulation may occur in patients with moderate to severe hepatic impairment (see WARNINGS AND PRECAUTIONS).

CONTRAINDICATIONS
COSUDEX is contraindicated in females and children.

COSUDEX must not be given to any patient who has shown a hypersensitivity reaction to the active substance or to any of the excipients.

WARNINGS AND PRECAUTIONS
Bicalutamide is extensively metabolised in the liver. Data suggest that its elimination may be slower in subjects with severe hepatic impairment and this could lead to increased accumulation of bicalutamide. Therefore, COSUDEX should be used with caution in patients with moderate to severe hepatic impairment.
Periodic liver function testing should be considered due to the possibility of hepatic changes.

Severe hepatic changes and hepatic failure have been observed rarely with COSUDEX, and fatal outcomes have been reported (see ADVERSE EFFECTS). COSUDEX therapy should be discontinued if changes are severe.

A reduction in glucose tolerance has been observed in males receiving LHRH agonists. This may manifest as diabetes or loss of glycaemic control in those with pre-existing diabetes. Consideration should therefore be given to monitoring blood glucose in patients receiving COSUDEX in combination with LHRH agonists.

Androgen deprivation therapy may prolong the QT interval, although a causal association has not been established with COSUDEX. In patients with a history of or who have risk factors for QT prolongation and in patients receiving concomitant medicinal products that may prolong the QT interval (see INTERACTIONS) physicians should assess the benefit risk ratio including the potential for Torsade de Pointes prior to initiating COSUDEX.

Antiandrogen therapy may cause morphological changes in spermatozoa. Although the effect of bicalutamide on sperm morphology has not been evaluated and no such changes have been reported for patients who received COSUDEX, patients and/or their partners should use adequate contraception methods during and for 130 days after COSUDEX therapy.

**PREGNANCY AND LACTATION**

COSUDEX is contraindicated in females and must not be given to pregnant women or nursing mothers.

**EFFECTS ON ABILITY TO DRIVE AND USE MACHINES**

During treatment with COSUDEX, somnolence has been reported and those patients who experience this symptom should observe caution when driving or using machines.

**ADVERSE EFFECTS**

Unless specified, the following frequency categories were assigned based on the incidence of the adverse event in the 50 mg COSUDEX plus LHRH analogue arm of the pivotal LHRH combination study.

<table>

</table>

\(^a\) May be reduced by concomitant castration.
\(^b\) Hepatic changes are rarely severe and were frequently transient, resolving or improving with continued therapy or following cessation of therapy.
\(^c\) Listed as an adverse drug reaction following review of post-marketed data. Frequency has been determined from the incidence of reported adverse events of interstitial pneumonia in the randomised treatment period of the 150 mg EPC studies.
\(^d\) Listed as an adverse drug reaction following review of post-marketed data. Frequency has been determined from the incidence of reported adverse events of hepatic failure in patients receiving treatment in the open-label COSUDEX arm of the 150 mg EPC studies.
\(^e\) Observed in a pharmacoepidemiology study of LHRH agonists and anti-androgens used in the treatment of prostate cancer. The risk appeared to be increased when COSUDEX 50 mg was used in combination with LHRH agonists.

**INTERACTIONS**

There is no evidence of any pharmacodynamic or pharmacokinetic interactions between COSUDEX and GnRH analogues.
In vitro studies have shown that R-bicalutamide is an inhibitor of CYP3A4, with lesser inhibitory effects on CYP 2C9, 2C19 and 2D6 activity.

Although in vitro studies have suggested the potential for COSUDEX to inhibit cytochrome 3A4, a number of clinical studies show the magnitude of any inhibition is unlikely to be of clinical significance.

In vitro studies have shown that COSUDEX can displace the coumarin anticoagulant, warfarin, from its protein binding sites. It is therefore recommended that if COSUDEX is started in patients who are already receiving coumarin anticoagulants, prothrombin time should be closely monitored.

Although there is no evidence of any pharmacodynamic or pharmacokinetic interactions between COSUDEX 50 mg and LHRH agonists at steady state, COSUDEX 50 mg may prevent the harmful clinical consequences of flare associated with the start of LHRH agonist therapy.

Since androgen deprivation treatment may prolong the QT interval, the concomitant use of COSUDEX with medicinal products known to prolong the QT interval or medicinal products able to induce Torsade de Pointes should be carefully evaluated (see WARNINGS AND PRECAUTIONS).

OVERDOSAGE
There is no human experience of overdosage. There is no specific antidote; treatment should be symptomatic. Dialysis may not be helpful, since COSUDEX is highly protein bound and is not recovered unchanged in the urine. General supportive care, including frequent monitoring of vital signs, is indicated.

PHARMACOLOGICAL PROPERTIES

PHARMACODYNAMIC PROPERTIES
COSUDEX is a non-steroidal anti-androgen, devoid of other endocrine activity. It binds to androgen receptors without activating gene expression, and thus inhibits the androgen stimulus. Regression of prostatic tumours results from this inhibition. Clinically, discontinuation of COSUDEX can result in antiandrogen withdrawal syndrome in a subset of patients.

COSUDEX is a racemate with its antiandrogenic activity being almost exclusively in the R-enantiomer.

PHARMACOKINETIC PROPERTIES
COSUDEX is well absorbed following oral administration. There is no evidence of any clinically relevant effect of food on bioavailability.

The (S)-enantiomer is rapidly cleared relative to the (R)-enantiomer, the latter having a plasma elimination half-life of about 1 week.

On daily administration of COSUDEX, the (R)-enantiomer accumulates about 10-fold in plasma as a consequence of its long half-life.

Steady state plasma concentrations of the (R)-enantiomer of approximately 9 µg/mL are observed during daily administration of 50 mg doses of COSUDEX. At steady state the
predominantly active (R)-enantiomer accounts for 99% of the total circulating enantiomers.

The pharmacokinetics of the (R)-enantiomer are unaffected by age, renal impairment or mild to moderate hepatic impairment. There is evidence that for subjects with severe hepatic impairment, the (R)-enantiomer is more slowly eliminated from plasma.

COSUDEX is highly protein bound (racemate 96%, R-bicalutamide 99.6%) and extensively metabolised (oxidation and glucuronidation); its metabolites are eliminated via the kidneys and bile in approximately equal proportions.

In a clinical study the mean concentration of R-bicalutamide in semen of men receiving Cosudex 150 mg was 4.9 µg/mL. The amount of bicalutamide potentially delivered to a female partner during intercourse is low and equates to approximately 0.3 µg/kg. This is below that required to induce changes in offspring of laboratory animals.

PHARMACEUTICAL PRECAUTIONS

INSTRUCTIONS FOR USE/HANDLING
No special precautions required.

INCOMPATIBILITIES
None known.

SHELF LIFE
5 years

SPECIAL PRECAUTIONS FOR STORAGE
Store below 30°C.

MEDICINE CLASSIFICATION
Prescription Medicine.

PACKAGE QUANTITIES
COSUDEX 50 mg tablets, blister pack 28 tablets.

FURTHER INFORMATION

PRECLINICAL INFORMATION
Bicalutamide is a potent antiandrogen and a mixed function oxidase enzyme inducer in animals. Target organ changes, including tumour induction and minor clinical pathology changes, are related to these activities. Enzyme induction and minor cardiac changes seen in dogs have not been observed in man. There are no preclinical findings that preclude the administration of COSUDEX to prostate cancer patients.

LIST OF EXCIPIENTS
- Lactose Monohydrate
- Sodium Starch Glycollate
- Povidone
• Magnesium Stearate
• Hypromellose
• Macrogol 300
• Titanium Dioxide
