NEW ZEALAND DATASHEET

Clopidogrel Sandoz®
Clopidogrel film-coated tablets 75mg

Name of the medicine
Generic name: Clopidogrel hydrogen sulfate
Chemical name: Methyl (+)-(S)-α-(2-chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetate sulfate (1:1)

CAS: 120202-66-6 (Clopidogrel hydrogen sulfate)
113 665-84-2 (Clopidogrel base)

Empirical formula: C_{16}H_{16}ClNO_{2}S.H_{2}SO_{4}  MW: 419.9

Description
Clopidogrel hydrogen sulfate is a white to off-white powder. It is practically insoluble in water at neutral pH but freely soluble at pH 1. It is freely soluble in methanol, sparingly soluble in methylene chloride and is practically insoluble in ethyl ether. It has a specific optical rotation of about +56°.

Each tablet contains mannitol, microcrystalline cellulose, hydroxypropylcellulose, hydrogenated vegetable oil, Opadry Pink 03B54942 and Opacode S-1-17823 Black.

Pharmacology

Pharmacodynamics
Clopidogrel is a specific and potent inhibitor of platelet aggregation. Platelets have an established role in the pathophysiology of atherosclerotic disease and thrombotic events. Long term use of anti-platelet drugs has shown consistent benefit in the prevention of ischaemic stroke, myocardial infarction and vascular death in patients at increased risk of such outcomes, including those with established atherosclerosis or a history of atherothrombosis.

Clopidogrel selectively inhibits the binding of adenosine diphosphate (ADP) to its platelet receptor, and the subsequent ADP-mediated activation of the GPIIb/IIIa complex, thereby inhibiting platelet aggregation. Biotransformation of clopidogrel is necessary to produce inhibition of platelet aggregation. The active metabolite, a thiol derivative, is formed by oxidation of clopidogrel to 2-oxoclopidogrel and subsequent hydrolysis. The active thiol metabolite, which has been isolated in vitro, binds rapidly and irreversibly to platelet ADP receptors, P2Y12, thus inhibiting platelet...
aggregation. Clopidogrel also inhibits platelet aggregation induced by other agonists by blocking the amplification of platelet activation by released ADP. Due to the irreversible binding, platelets exposed are affected for the remainder of their lifespan and recovery of normal platelet function occurs at a rate consistent with platelet turnover (approximately 7 days).

Statistically significant and dose-dependent inhibition of platelet aggregation was noted 2 hours after single oral doses of clopidogrel. Repeated doses of 75mg per day produced substantial inhibition of ADP-induced platelet aggregation from the first day; this increased progressively and reached steady state between Day 3 and Day 7. At steady state, the average inhibition level observed with a dose of 75mg per day was between 40% and 60%. Platelet aggregation and bleeding time gradually returned to baseline values, generally within 7 days after treatment was discontinued.

**Pharmacokinetics**

After repeated oral doses of 75mg per day, a single oral dose of clopidogrel is rapidly absorbed. However, plasma concentrations of the parent compound are very low and below the quantification limit (0.00025mg/L) beyond 2 hours. Absorption is at least 50%, based on urinary excretion of clopidogrel metabolites.

Clopidogrel is extensively metabolised by the liver and the main metabolite, which is inactive, is the carboxylic acid derivative which represents about 85% of the circulating compound in plasma. Peak plasma levels of this metabolite (approx. 3mg/L after repeated 75mg oral doses) occurred approximately 1 hour after dosing.

The kinetics of the main circulating metabolite were linear (plasma concentrations increased in proportion to dose) in the dose range of 50 to 150mg of clopidogrel.

Clopidogrel and the main circulating metabolite bind reversibly in vitro to human plasma proteins (98% and 94% respectively). The binding is non saturable in vitro over a wide concentration range.

Following an oral dose of $^{14}$C-labelled clopidogrel in man, approximately 50% was excreted in the urine and approximately 46% in the faeces in the 120 hour interval after dosing. The elimination half-life of the main circulating metabolite was 8 hours after single and repeated administration.

Plasma concentrations of the main circulating metabolite were significantly higher in elderly subjects (≥ 75 years) as compared to young healthy volunteers. However, these higher plasma levels were not associated with differences in platelet aggregation and bleeding time.

Plasma levels of the main circulating metabolite were lower in subjects with severe renal disease (creatinine clearance from 5 to 15mL/min) compared to subjects with moderate renal disease (creatinine clearance from 30 to 60mL/min) and healthy subjects, after repeated doses of 75mg/day. Although inhibition of ADP-induced platelet aggregation was lower (25%) than that observed in healthy subjects, the prolongation of bleeding was similar to that seen in healthy subjects receiving 75mg of clopidogrel per day.

Administration of a single dose of 75mg clopidogrel to healthy subjects under fasting conditions achieved a mean peak plasma concentration of clopidogrel of 605.65pg/mL within 0.76 hours for Clopidogrel Sandoz and 635.81pg/mL within 0.90 hours for a reference clopidogrel film-coated tablet product. The mean AUC$_{0\text{-inf}}$ was 978.80pg·h/mL for Clopidogrel Sandoz and 1067.41pg·h/mL for a reference clopidogrel film-coated tablet product. The elimination half-life of clopidogrel was 4.5 hours after single administration of Clopidogrel Sandoz.

**Special Populations**

**Geriatric Patients**

Plasma concentrations of the main circulating metabolite are significantly higher in the elderly (≥ 75 years) compared to young healthy volunteers but these higher plasma levels were not associated with differences in platelet aggregation and bleeding time. No dosage adjustment is needed for the elderly.
Renally Impaired Patients

After repeated doses of 75mg clopidogrel per day, plasma levels of the main circulating metabolite were lower in patients with severe renal impairment (creatinine clearance from 5 to 15mL/min) compared to subjects with moderate renal impairment (creatinine clearance 30 to 60mL/min) or healthy subjects. Although inhibition of ADP-induced platelet aggregation was lower (25%) than that observed in healthy volunteers, the prolongation of bleeding time was similar in healthy volunteers receiving 75mg of clopidogrel per day. No dosage adjustment is needed in renally impaired patients. However, experience with clopidogrel is limited in patients with severe renal impairment. Therefore clopidogrel should be used with caution in this population.

Gender

No significant difference was observed in the plasma levels of the main circulating metabolite between males and females. In a small study comparing men and women, less inhibition of ADP-induced platelet aggregation was observed in women, but there was no difference in prolongation of bleeding time. In the large, controlled clinical study (Clopidogrel vs. Aspirin in Patients at Risk of Ischemic Events; CAPRIE), the incidence of clinical outcome events, other adverse clinical events, and abnormal clinical laboratory parameters was similar in men and women.

Race

Pharmacokinetic differences due to race have not been studied.

Clinical trials

The safety and efficacy of clopidogrel in preventing vascular ischaemic events has been evaluated in the CAPRIE study, a double-blind clinical trial comparing clopidogrel to aspirin. In addition, three other studies (CURE, CLARITY and COMMIT) have been conducted for unapproved indications.

Myocardial Infarction or Stroke, or Established Peripheral Arterial Disease

The CAPRIE study included 19,185 patients with established atherosclerosis or history of atherothrombosis as manifested by myocardial infarction, ischaemic stroke or peripheral arterial disease. Patients were randomised to clopidogrel 75mg/day or aspirin 325mg/day, and were followed for 1 to 3 years.

The trial’s primary outcome was the time to first occurrence of new ischaemic stroke (fatal or not), new myocardial infarction (fatal or not), or other vascular death. Deaths not easily attributable to nonvascular causes were all classified as vascular.

</tbody>
</table>

As shown in the table above, clopidogrel was associated with a lower incidence of outcome events of every kind. The overall risk reduction (9.78% vs. 10.64%) was 8.7%, p=0.045. Similar results were obtained when all-cause mortality and all-cause strokes were counted instead of vascular mortality and ischaemic strokes (risk reduction 6.9%). In patients who survived an on-study stroke or myocardial infarction, the incidence of subsequent events was again lower in the clopidogrel group.

The curves showing the overall event rate are shown in the figure below. The event curves separated early and continued to diverge over the 3-year follow-up period.
Indications
Prevention of vascular ischaemia associated with atherothrombotic events (myocardial infarction, stroke and vascular death) in patients with a history of symptomatic atherosclerotic disease.

Contraindications
Hypersensitivity to clopidogrel or any of the excipients.
Severe liver impairment.
Active pathological bleeding such as peptic ulcer and intracranial haemorrhage.
Breast-feeding (see PRECAUTIONS-Pregnancy and Lactation).

Precautions
General
As with the other anti-platelet agents, clopidogrel prolongs bleeding time and should be used with caution in patients who may be at risk of increased bleeding from trauma, surgery or other pathological conditions, and in patients receiving treatment with acetylsalicylic acid, heparin, glycoprotein IIb/IIIa inhibitors, non-steroidal anti-inflammatory drugs (NSAIDs) or selective-serotonin reuptake inhibitors as follows:

- If a patient is to undergo elective surgery and an anti-platelet effect is not desired, clopidogrel should be discontinued at least 5 days prior to surgery.

- If the patient is at high risk of ophthalmic bleeding due to intraocular lesions clopidogrel should be used with extra caution.

- Although clopidogrel has shown a lower incidence of gastrointestinal bleeding compared to aspirin in a large controlled clinical trial (CAPRIE), the drug should be used with caution in patients who have lesions with a propensity to bleed. Drugs that might induce such lesions (such as aspirin and Non-Steroidal Anti-Inflammatory Drugs) should be used with caution in
patients taking clopidogrel (see PRECAUTIONS-Interactions With Other Medicines).

- Patients should be told that it may take longer than usual for bleeding to stop when they take clopidogrel, and that they should report any unusual bleeding (site or duration) to their physician. Patients should inform physicians and dentists that they are taking clopidogrel before any surgery is scheduled and before any new drug is taken.

- In patients with recent transient ischaemic attack or stroke who are at high risk of recurrent ischaemic events, the combination of aspirin and clopidogrel has been shown to increase major bleeding.

**Coronary Artery Bypass Surgery**

When coronary artery bypass surgery is to be performed, clopidogrel should be suspended at least 5 days before surgery to reduce the risk of bleeding (see ADVERSE EFFECTS).

**Pharmacogenetics**

Based on literature data, patients with genetically reduced CYP2C19 function have lower systemic exposure to the active metabolite of clopidogrel and diminished antiplatelet responses, and generally exhibit higher cardiovascular event rates following myocardial infarction than do patients with normal CYP2C19 function.

**Renal impairment**

Experience with clopidogrel is limited in patients with severe renal impairment. Therefore clopidogrel should be used with caution in this population.

**Hepatic impairment**

Experience is limited in patients with moderate hepatic disease who may have bleeding diatheses. Clopidogrel should therefore be used with caution in this population.

In the CAPRIE study, it was not mandatory to discontinue study medication in the case of an acute outcome event (acute myocardial infarction, ischaemic stroke or lower extremity amputation) and the patients had a favourable outcome as compared to the aspirin group.

In view of the lack of data, clopidogrel cannot be recommended in acute ischaemic stroke (less than 7 days).

**Haematological**

Thrombotic Thrombocytopenic Purpura (TTP) has been reported very rarely following the use of clopidogrel, sometimes after a short exposure. It is characterised by thrombocytopenia and microangiopathic haemolytic anaemia associated with either neurological findings, renal dysfunction or fever. TTP is a potentially fatal condition requiring prompt treatment, including plasmapheresis.

Thrombocytopenia, neutropenia, aplastic anaemia and pancytopenia have also been reported very rarely in patients taking clopidogrel (see ADVERSE EFFECTS).

Due to the risk of bleeding and haematological undesirable effects, blood cell count determination and/or other appropriate testing should be promptly considered whenever clinical symptoms suggestive of bleeding arise during the course of treatment. As with other anti-platelet agents, clopidogrel should be used with caution in patients who may be at risk of increased bleeding from trauma, surgery or other pathological conditions and in patients receiving treatment with aspirin, non-steroidal anti-inflammatory drugs, heparin, glycoprotein IIb/IIIa inhibitors or thrombolytics. Patients should be followed carefully for any signs of bleeding including occult bleeding, especially during the first weeks of treatment and/or after invasive cardiac procedures or surgery.
**Acquired haemophilia**

Acquired haemophilia has been reported following the use of clopidogrel. In cases of confirmed isolated activated Partial Thromboplastin Time (aPTT) prolongation with or without bleeding, acquired haemophilia should be considered. Patients with a confirmed diagnosis of acquired haemophilia should be managed and treated by specialists and clopidogrel should be discontinued.

**Allergic cross-reactivity**

Patients should be evaluated for history of hypersensitivity to another thienopyridine (such as ticlopidine, prasugrel) since allergic cross-reactivity among thienopyridines has been reported (see ADVERSE EFFECTS). Patients who have had previous hypersensitivity to other thienopyridines should be carefully monitored for signs of hypersensitivity to clopidogrel during treatment.

**Effects on fertility**

Clopidogrel was found to have no effect on fertility of male and female rats at oral doses up to 400mg/kg per day and was not teratogenic in rats (up to 500mg/kg per day) and rabbits (up to 300mg/kg per day).

**Use in pregnancy (Category B1)**

Clopidogrel and/or its metabolites are known to cross the placenta in pregnant rats and rabbits. However, teratology studies in rats and rabbits at doses up to 500mg and 300mg/kg/day PO, respectively, revealed no evidence of embryotoxicity or teratogenicity. There are no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of a human response, clopidogrel should not be used in women during pregnancy.

**Use in lactation**

Studies in rats have shown that clopidogrel and/or its metabolites are excreted in breast milk (see CONTRAINDICATIONS).

**Carcinogenicity**

There was no evidence of carcinogenic effects when clopidogrel was given in the diet for 78 weeks to mice and 104 weeks to rats at doses up to 77mg/kg per day (representing an exposure = 18 times the anticipated patient exposure, based on plasma AUC for the main circulating metabolite in elderly subjects).

**Genotoxicity**

Clopidogrel was not genotoxic in four in vitro tests (Ames test, DNA-repair test in rat hepatocytes, gene mutation assay in Chinese hamster fibroblasts and metaphase chromosome analysis of human lymphocytes) and in one in vivo test (micronucleus test by the oral route in mice).

**Interactions with other medicines**

**Aspirin**

A pharmacodynamic interaction between clopidogrel and aspirin is possible, leading to increased risk of bleeding (see also PRECAUTIONS – General).

**Injectable Anticoagulants**

A pharmacodynamic interaction between clopidogrel and heparin is possible, leading to increased risk of bleeding. Therefore, concomitant use should be undertaken with caution.
Anti-platelet agents (such as eptifibatide, ticlopidine, tirofiban)
The effects of clopidogrel and other drugs which inhibit platelet aggregation may be additive, leading
to an increased risk of bleeding.

Glycoprotein IIb/IIIa inhibitors
Clopidogrel should be used with caution in patients who may be at risk of increased bleeding from
trauma, surgery or other pathological conditions that receive concomitant glycoprotein IIb/IIIa
inhibitors.

Thrombolytics
The safety of the concomitant administration of clopidogrel, fibrin or non-fibrin specific thrombolytic
agents and heparins was assessed in patients with acute myocardial infarction. The incidence of
clinically significant bleeding was similar to that observed when thrombolytic agents and heparins are
co-administered with aspirin. The safety of concomitant administration of clopidogrel with thrombolytic
agents has not been formally established and should be undertaken with caution.

Oral Anticoagulants (including warfarin)
The concomitant administration of clopidogrel with warfarin is not recommended since it may increase
the intensity of bleeding.

Non Steroidal Anti-inflammatory Drugs (NSAIDs)
In a clinical study conducted in healthy volunteers, the concomitant administration of clopidogrel and
naproxen increased occult gastrointestinal blood loss. However, due to the lack of interaction studies
with other NSAIDs, it is presently unclear whether there is an increased risk of gastrointestinal
bleeding with all NSAIDs. Consequently, there is a potential increased risk of gastrointestinal bleeding
and NSAIDs and clopidogrel should be co-administered with caution (see PRECAUTIONS).

Selective Serotonin Reuptake Inhibitors (SSRIs)
Since SSRI’s affect platelet activation and increase the risk of bleeding, the concomitant
administration of SSRI with clopidogrel should be undertaken with caution.

Drugs metabolised by Cytochrome P450 2C9
At high concentrations in vitro, clopidogrel inhibits cytochrome P450 (2C9). Accordingly, clopidogrel
may interfere with the metabolism of phenytoin, tamoxifen, tolbutamide, warfarin, fluvastatin, and
many non-steroidal anti-inflammatory agents, but there are no data with which to predict the
magnitude of these interactions. Caution should be used when any of these drugs is co-administered
with clopidogrel.

Other concomitant therapy
Since clopidogrel is metabolised to its active metabolite partly by CYP2C19, use of drugs that inhibit
the activity of this enzyme would be expected to result in reduced drug levels of the active metabolite
of clopidogrel and a reduction in clinical efficacy. Concomitant use of drugs that inhibit CYP2C19 (e.g.
omeprazole) should be discouraged.

Clopidogrel is metabolised to its active metabolite in part by CYP2C19. Concomitant use of drugs that
inhibit the activity of this enzyme results in reduced plasma concentrations of the active metabolite
of clopidogrel and a reduction in platelet inhibition. Avoid concomitant use of drugs that inhibit CYP2C19,
including omeprazole, carbamazepine, moclobemide, ciprofloxacin, chloramphenicol, esomeprazole,
cimetidine, fluconazole, ketoconazole, voriconazole, etravirine, felbamate, fluoxetine, fluvoxamine and
ticlopidine.

Studies of specific drug interactions yielded the following results:

Omeprazole: In a crossover clinical study, 72 healthy subjects were administered clopidogrel (300mg
loading dose followed by 75mg/day) alone and omeprazole (80mg at the same time as clopidogrel) for
5 days. The exposure to the active metabolite of clopidogrel was decreased by 46% (day 1) and 42%
day 5) when clopidogrel and omeprazole were administered together. Mean inhibition of platelet
aggregation (IPA) was diminished by 47% (24 hours) and 30% (day 5) when clopidogrel and omeprazole were administered together. In another study 72 healthy subjects were given the same doses of clopidogrel and omeprazole but the drugs were administered 12 hours apart; the results were similar indicating that administering clopidogrel and omeprazole at different times does not prevent their interaction.

A number of other clinical studies have been conducted with clopidogrel and other concomitant medications to investigate the potential for pharmacodynamic and pharmacokinetic interactions. No clinically significant pharmacodynamic interactions were observed when clopidogrel was co-administered with atenolol, nifedipine, or both atenolol and nifedipine. Furthermore, the pharmacodynamic activity of clopidogrel was not significantly influenced by the co-administration of phenobarbital, cimetidine, or oestrogen.

The pharmacokinetics of digoxin or theophylline were not modified by the co-administration of clopidogrel. Antacids did not modify the extent of clopidogrel absorption.

In addition to the above specific interaction studies, patients entered into clinical trials with clopidogrel received a variety of concomitant medications including diuretics, beta-blocking agents, angiotensin converting enzyme inhibitors, calcium antagonists, cholesterol lowering agents, coronary vasodilators, anti-diabetic agents (including insulin), anti-epileptic agents, GPIIb/IIIa antagonists and hormone replacement therapy without evidence of clinically significant adverse interactions.

Effects on ability to drive and use machines

No impairment of driving or psychometric performance was observed following clopidogrel administration.

Adverse effects

Clinical Studies Experience

Clopidogrel has been evaluated for safety in more than 42,000 patients, including over 9,000 patients treated for 1 year or more. The clinically relevant adverse events observed in CAPRIE are discussed below.

Clopidogrel was well tolerated compared to aspirin in a large controlled clinical trial (CAPRIE). The overall tolerability of clopidogrel in this study was similar to aspirin, regardless of age, gender and race.

Haemorrhagic disorders

In CAPRIE, the overall incidence of any bleeding in patients treated with either clopidogrel or aspirin was similar (9.3%). The incidence of severe bleeds was 1.4% in the clopidogrel group and 1.6% in the aspirin group.

Gastrointestinal haemorrhage was significantly less frequent with clopidogrel (1.99%) compared to aspirin (2.66%). The incidence of intracranial haemorrhage was 0.35% for clopidogrel compared to 0.49% for aspirin.

Haematological disorders

In CAPRIE, patients were intensively monitored for thrombocytopenia and neutropenia.

Clopidogrel was not associated with an increase in the incidence of thrombocytopenia compared to aspirin. Very rare cases of platelet count <30 x 10^9/L have been reported.

Severe neutropenia (<0.45 x 10^9/L) was observed in four patients (0.04%) that received clopidogrel and in two patients that received aspirin. Two of the 9599 patients who received clopidogrel and none of the patients who received aspirin had a neutrophil count of zero. One of the clopidogrel treated patients was receiving cytostatic chemotherapy, and another recovered and returned to the trial after
only temporarily interrupting treatment with clopidogrel.

Although the risk of myelotoxicity with clopidogrel appears to be quite low, this possibility should be considered when a patient receiving clopidogrel demonstrates fever or other signs of infection.

**Gastrointestinal**
In CAPRIE, overall the incidence of gastrointestinal events (e.g. abdominal pain, dyspepsia, gastritis and constipation) in patients receiving clopidogrel was significantly lower than in those receiving aspirin. The incidence of peptic, gastric, or duodenal ulcers was 0.68% for clopidogrel and 1.15% for aspirin. Cases of diarrhoea were reported at a higher frequency in the clopidogrel group (4.46%) compared to the aspirin group (3.36%).

**Rash**
In CAPRIE, there were significantly more patients with rash in the clopidogrel group (4.2%) compared to the aspirin group (3.5%).

**Treatment Discontinuation**
In the clopidogrel and aspirin treatment groups of the CAPRIE study, discontinuation due to adverse events occurred in approximately 13% of patients after 2 years of treatment. Adverse events occurring in ≥ 2.5% of patients on clopidogrel in the CAPRIE controlled clinical trial are shown in the table below regardless of relationship to clopidogrel. The median duration of therapy was 20 months, with a maximum of 3 years.
Adverse events occurring in ≥ 2.5% of patients receiving clopidogrel in CAPRIE

* indicates statistical significance (p<0.05).

Incidence of discontinuation, regardless of relationship to therapy is shown in parentheses.

Clinically relevant adverse reactions not listed above pooled from CAPRIE, CURE, CLARITY and
COMMIT studies with an incidence of ≥ 0.1% as well as all serious and clinically relevant adverse reactions are listed below according to the World Health Organisation classification. Their frequency is defined using the following conventions: common: > 1/100 (1%) and < 1/10 (10%); uncommon: ≥ 1/1000 (0.1%) and < 1/100 (1%) and rare: ≥ 1/10000 (0.01%) and < 1/1000 (0.1%).

Central and peripheral nervous system disorders
Uncommon: Paraesthesia

Rare: Vertigo

Gastrointestinal system disorders
Uncommon: Flatulence, constipation, vomiting, gastric, peptic or duodenal ulcer

Platelet, bleeding and clotting disorders
Uncommon: Bleeding time increased

White cell and RES disorders
Uncommon: Leucopenia and eosinophilia

Post-Marketing Experience
The following have been reported spontaneously from worldwide post-marketing experience:

Note:
very common ≥ 1/10 (≥ 10%)
common ≥ 1/100 and < 1/10 (≥ 1% and < 10%)
uncommon ≥ 1/1000 and < 1/100 (≥ 0.1% and < 1.0%)
rare ≥ 1/10,000 and < 1/1000 (≥ 0.01% and < 0.1%)
very rare < 1/10,000 (< 0.01%)

Musculoskeletal, connective and bone
Very rare: Arthralgia, arthritis, myalgia

Immune system disorders
Very rare: anaphylactoid reactions, serum sickness

Vascular disorders
Very rare: vasculitis, hypotension

Blood and lymphatic system disorders
Rare: Neutropenia (including severe neutropenia)

Very rare: serious cases of bleeding, mainly skin, musculo-skeletal (haemarthrosis, haematoma), eye (conjunctival, ocular, retinal) and respiratory tract bleeding (haemoptysis, pulmonary haemorrhage), epistaxis, haematuria and haemorrhage of operative wound. Fatal haemorrhage, including intracranial, gastrointestinal and retroperitoneal haemorrhage. Cases of serious haemorrhage have been reported in patients taking clopidogrel concomitantly with aspirin or clopidogrel with aspirin and heparin (see PRECAUTIONS - Interactions with Other Medicines)

Very rare cases of thrombotic thrombocytopenic purpura (TTP) have been reported. Very rare cases of acquired haemophilia A have been reported.

Very rare: aplastic anaemia, pancytopenia, agranulocytosis, granulocytopenia, anaemia

Uncommon: thrombocytopenia, eosinophilia, leucopenia, decreased neutrophils, decreased platelets, increased bleeding time
Skin and Subcutaneous tissue disorders
Common: bruising

Uncommon: rash, pruritus, skin bleeding (purpura)

Very rare: maculopapular, exfoliative or erythematous rash, urticaria, angioedema, bullous dermatitis (erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis), eczema, lichen planus, drug-induced hypersensitivity syndrome, drug rash with eosinophilia and systemic symptoms (DRESS)

Psychiatric
Very rare: confusion, hallucinations

Nervous System disorders
Uncommon: intracranial bleeding (some cases were reported with fatal outcome), headache, paraesthesia, dizziness

Very rare: taste disturbances

Eye disorders
Very rare: serious cases of eye bleeding (conjunctival, ocular, retinal)

Ear and Labyrinth disorders
Rare: vertigo

Hepatobiliary disorders
Very rare: hepatitis, acute liver failure

Gastrointestinal disorders
Common: gastrointestinal haemorrhage, diarrhoea, abdominal pain, dyspepsia

Uncommon: gastric ulcer and duodenal ulcer, vomiting, gastritis, nausea, constipation, flatulence

Rare: retro-peritoneal haemorrhage

Very rare: gastrointestinal and retroperitoneal haemorrhage with fatal outcome, colitis (including ulcerative or lymphocytic colitis), pancreatitis, stomatitis

Respiratory, thoracic and mediastinal disorders
Common: epistaxis

Very rare: respiratory tract bleeding (haemoptysis, pulmonary haemorrhage), bronchospasm, interstitial pneumonitis, eosinophilic pneumonia

Renal and Urinary disorders
Uncommon: haematuria

Very rare: glomerulopathy, glomerulonephritis, blood creatinine increased

Investigations
Uncommon: bleeding time prolonged, neutrophil count decreased, platelet count decreased

Very rare: blood creatinine increase, abnormal liver function tests

General disorders and administration site conditions
Common: bleeding at the puncture site
Very rare: fever, syncope

**Dosage and administration**

Clopidogrel should be taken once a day with or without food.

**Adults**

Generally, clopidogrel should be given as a single daily dose of 75mg.

No dosage adjustment is necessary for either elderly patients or patients with renal impairment. (see PHARMACOKINETICS).

**Children and adolescents**

Safety and efficacy in subjects below the age of 18 have not been established.

**Overdosage**

Contact the Poisons Information Centre on 0800 POISON or 0800 764766 for advice on management of overdose.

In animals, clopidogrel at single oral doses ≥ 1500mg/kg caused necrotic-haemorrhagic gastritis, oesophagitis and enteritis in mice, rats and baboons. Necrotic tubulopathy and tubulo-interstitial nephritis were also noted in mice.

Overdose following clopidogrel administration may lead to prolonged bleeding time and subsequent bleeding complications. Appropriate therapy should be considered if bleeding is observed. No antidote to the pharmacological activity of clopidogrel has been found. If prompt correction of prolonged bleeding time is required, platelet transfusion may reverse the effects of clopidogrel.

**Presentation and storage conditions**

Clopidogrel Sandoz 75mg film-coated tablets - Pink colored film coated round shaped tablets with imprinted on one side and plain on the other side.

Blister pack containing 28 tablets.

Store below 25°C.

**Medicine classification**

Prescription Medicine

**Name and address**

Novartis New Zealand Limited
