Ursosan[®]

Ursodeoxycholic acid Capsules 250 mg

This product may not be interchangeable with similar products on the New Zealand market.

Presentation

One Ursosan capsule contains ursodeoxycholic acid (UDCA) 250 mg.

Ursosan capsules are white hard gelatin capsules, containing a white or almost white powder.

Indications

Ursosan is indicated in the treatment of chronic cholestatic liver diseases, including primary biliary cirrhosis (PBC) and primary sclerosing cholangitis (PSC).

In primary biliary cirrhosis ursodeoxycholic acid improves liver enzymes and IgM and prevents worsening of liver histology in patients with less advanced forms of the disease, i.e. serum bilirubin less than 2 mg/dL and histologic changes in liver confined to the portal regions. Prevention of complications of chronic liver disease has not been established.

Dosage and Administration

Adults

The degree of biliary enrichment of UDCA does not depend on the formulation or the number of doses administered per day, but rather the total daily dose.

10 – 15 mg UDCA per kg per day in either a single dose or two to four divided doses are recommended for PBC (primary biliary cirrhosis) and chronic cholestatic liver diseases other than CF (cystic fibrosis). This dose can be approximated as follows:

Body weight (kg)	Daily dose (capsules)	Number of capsules		
		Morning	Noon	Evening
34 - 50	2	1	-	1
51 - 65	3	1	1	1
66 - 85	4	1	1	2
86 - 110	5	1	2	2
Over 110	6	2	2	2

Ursosan

For CF, the general recommended dose is up to 20 mg/kg/day. This dose has been shown to improve histology in PSC patients.

Children

Data on use in children are very limited. In the few available studies, dosages used have generally been up to 15 - 20 mg/kg/day.

Elderly

In worldwide clinical studies of UDCA, approximately 14% of subjects were over 65 years of age (approximately 3% were over 75 years old). In a subgroup analysis of existing clinical trials, patients greater than 56 years of age did not exhibit statistically significantly different complete dissolution rates from the younger population. No age-related differences in safety and effectiveness were found. Other reported clinical experience has not identified difference in response in elderly and younger patients. However, small differences in efficacy and greater sensitivity of some elderly individuals taking UDCA cannot be ruled out. Therefore, it is recommended that dosing proceed with caution in this population.

In patients with primary biliary cirrhosis, there may, in rare cases, be an initial deterioration in symptoms, e.g. itching. If this is the case, therapy can be continued with one capsule of Ursosan daily, and the daily dose gradually increased until the recommended daily dose has been reached.

For patients taking bile acid binding resins for relief of pruritus, Ursosan should be administered either 2 - 3 hours before or 4 hours after the doses of the resin.

Contraindications

Ursosan must not be used in the presence of acute inflammation of the gall bladder and bile ducts; and obstruction of the biliary tract (common bile duct).

UDCA will not dissolve calcified cholesterol stones, radio-opaque stones or radiolucent bile pigment stones. Hence patients with such stones are not candidates for UDCA therapy.

Patients with compelling reasons for cholecystectomy including unremitting acute cholecystitis, cholangitis, biliary obstruction, gallstone pancreatitis or biliary-gastrointestinal fistula are not candidates for UDCA therapy.

Allergy to bile acids.

Warnings and Precautions

UDCA has not been associated with liver damage.

Lithocholic acid, a naturally occurring bile acid, is known to be a liver-toxic metabolite. This bile acid is formed in the gut from UDCA less efficiently and in smaller amounts than that seen from chenodiol. Lithocholic acid is detoxified in the liver by sulfation and although man appears to be an efficient sulfater, it is possible that some patients may have a congenital or acquired deficiency in sulfation, thereby predisposing them to lithocholate induced liver damage.

Abnormalities in liver enzymes have not been associated with UDCA therapy and in fact UDCA has been shown to decrease liver enzyme levels in liver disease. However, during the first three months of therapy, it is advisable to monitor the liver parameters of AST (SGOT), ALT (SGPT), and GGT every 4 weeks, subsequently every 3 months.

Pre-existing radiolucent gallstones may occasionally become calcified. The clinical significance of this observation is unclear.

The effect of UDCA in patients with renal impairment has not been studied.

Use in pregnancy

Category B3.

UDCA has been shown to cross the placenta in rats. There was no evidence of a teratogenic effect of UDCA following oral administration to rats, mice or rabbits at doses of up to 4,000, 1,500 and 300 mg/kg/day, respectively. In one of two studies in rats, there was evidence of embryolethality, with a reduction in number of live fetuses and live births at oral doses of 2,000 mg/kg/day.

There are no adequate or well-controlled studies in pregnant women. Inadvertent exposure of 4 women to therapeutic doses in the first trimester of pregnancy during trials with UDCA led to no evidence of effects on the foetus or newborn baby. Although it seems unlikely, the possibility that ursodeoxycholic acid can cause foetal harm cannot be ruled out; hence, Ursosan is not recommended for use during pregnancy.

Women of childbearing potential should be advised to avoid becoming pregnant while receiving treatment with Ursosan.

Use in lactation

It is not known whether UDCA is excreted in human milk but small amounts of UDCA or its metabolites were excreted in milk of lactating rats following oral administration of 30 mg/kg. In an oral peri-postnatal study in rats, there was a slight transient reduction in postnatal body weight gain of pups at 2000 mg/kg/day. The possibility of adverse reactions on the infant should be considered if Ursosan is administered to a nursing mother. Alternatively, nursing can be discontinued.

Effects on ability to drive and use machines

No information provided.

Other

Carcinogenicity/mutagenicity and impairment of fertility

In two 24-month oral carcinogenicity studies in mice, ursodeoxycholic acid at doses up to 1,000 mg/kg/day was not tumourigenic. Based on body surface area (BSA), this dose represents 5 times the recommended maximum clinical dose of 16 mg/kg/day. In two 2-year oral carcinogenicity studies in rats, ursodeoxycholic acid at doses up to 300 mg/kg/day (3 times the recommended maximum human dose based on BSA) was not tumourigenic.

In 103-week oral carcinogenicity studies of lithocholic acid, a metabolite of ursodeoxycholic acid, doses up to 250 mg/kg/day in mice and 500 mg/kg/day in rats did not produce any tumours.

UDCA was not genotoxic in the following studies: gene mutation assays (*in vitro* Ames test, gene mutation assay at the TK locus in mouse lymphoma L5178Y cells), assays of chromosome aberrations (analysis of chromosome aberrations in Chinese hamster bone marrow and in spermatogonia of mice, and micronucleus test in hamsters) and assay of sister chromatid exchanges in cultured human lymphocytes.

In a fertility study in Sprague-Dawley rats at oral doses up to 2,700 mg/kg/day (27 times the maximum recommended human dose based on BSA), no adverse effect on male or female fertility or pregnancy outcome were observed. However, in an oral fertility study in Wistar rats, there was evidence of a reduction in female mating behaviour at doses \geq 250 mg/kg/day (2.5 times the maximum recommended human dose based on BSA) and of embryoletality (resulting in a reduction in number of live foetuses) at doses \geq 1,000 mg/kg/day.

Adverse Effects

UDCA is generally well tolerated with few side effects. Diarrhoea is the main reported side effect. The incidence of diarrhoea in controlled studies was up to 3%.

Some patients may experience increased pruritus in the early weeks of treatment. In such cases a dose reduction, and thereafter a slow (weekly) increase of dose to the recommended dose, may help.

Allergic reactions have been reported in some patients.

Other adverse reactions reported include increased cholestasis, nausea, vomiting and sleep disturbance.

The following tables provide comprehensive listings of the adverse experiences reported that occurred with a 5% incidence level:

GALLSTONE DISSOLUTION

	UDCA 8 - 10 mg/kg/day (N = 155)		Placebo (N = 159)

Interactions

Pharmacokinetic interactions

Some drugs, such as cholestyramine, charcoal, colestipol and certain antacids (e.g. aluminium hydroxide) bind bile acids *in vitro*. They could therefore have a similar effect *in vivo* and may interfere with the absorption of UDCA.

UDCA may increase the absorption of cyclosporin in transplantation and non-transplant patients. Therefore, monitoring cyclosporin plasma concentrations is recommended.

UDCA has been reported to decrease the absorption of ciprofloxacin in a few cases.

Oestrogens, oral contraceptives and clofibrate (and perhaps other lipid-lowering agents) increase hepatic cholesterol secretion, encourage cholesterol gallstone formation and hence may counteract the effectiveness of UDCA.

Pharmacodynamic interactions

Nil

Overdose

Serious adverse effects are unlikely to occur in overdosage. Doses of UDCA in the range of 16 - 20 mg/kg/day have been tolerated for 6 - 37 months without symptoms by 7 patients. The LD₅₀ for UDCA in rats is over 5,000 mg/kg given over 7 - 10 days and over 7,500 mg/kg for mice.

The most likely manifestation of severe overdose with UDCA would probably be diarrhoea, which should be treated symptomatically.

However, liver function should be monitored. If necessary, ion-exchange resins may be used to bind bile acids in the intestines.

For further information contact the National Poisons Centre on 0800 764 766.

Further Information

Actions

The mechanism of action of UDCA in liver and cholestatic disorders has not yet been explained totally. However, UDCA alters bile acid composition, resulting in increases in the concentration of UDCA and decreases in the concentrations of the more hydrophobic and potentially toxic bile acids, cholic and chenodeoxycholic acids. UDCA also has a choleric effect, resulting in increased bile acid output and bile flow. There is some evidence for immunological effects, including a reduction of abnormal expression of HLA Class I antigens on hepatocytes and a suppression of immunoglobulin and cytokine production.

Pharmacokinetics

UDCA occurs naturally in the body. After oral administration of a single 500 mg dose of UDCA to healthy volunteers, peak plasma concentrations were 7 to 16 μM . T_{max} occurs at 60 minutes and a second peak plasma concentration occurs at 180 minutes. After oral administration of 250 mg, 500 mg, 1000 mg and 2000 mg single doses, respective absorption rates were 60.3%, 47.7%, 30.7% and 20.7% based on recovery from bile within 24 hours in patients with external biliary drainage.

In plasma, protein binding is 96 - 98%.

First pass extraction of UDCA from the portal vein by the liver ranges from 50 - 70%. UDCA is conjugated to glycine and taurine and then excreted into bile and passes to the small bowel. In the intestine, some conjugates are deconjugated and reabsorbed in the terminal ileum. Conjugates may also be dehydroxylated to lithocholic acid, part of which is absorbed, sulphated by the liver and excreted by the biliary tract. In healthy volunteers given UDCA 500 mg with ^{14}C tracer, 30 - 44% of the dose was excreted in faeces in the first three days as UDCA (2 - 4%), lithocholic acid (37%) and 7-ketolithocholic acid (5%).

The biological half-life of orally administered UDCA is 3.5 - 5.8 days.

In patients with severe liver disease, renal excretion becomes a major route for elimination of bile acids.

Other

Nil

Chemical structure

The IUPAC chemical name of UDCA is 3 α , 7 β -dihydroxy-5-cholan-24-oic acid.

MW: 392.6

CAS number: 128-13-2

Ursodeoxycholic acid (UDCA) is a white or almost white powder. It is practically insoluble in water, readily soluble in alcohol, sparingly soluble in acetone, in chloroform and in ether. It melts at 200 - 204°C.

Excipients

The excipients of Ursosan capsules are starch – maize, starch – pregelatinised maize, magnesium stearate, silica – colloidal anhydrous, gelatin and titanium dioxide.
