1 Olimel® and PeriOlimel® (emulsions for infusion)
PeriOlimel N4-600E
Olimel N5-860E
Olimel N7-960
Olimel N7-960E
Olimel N9-840, and
Olimel N9-840E

2 QUALITATIVE AND QUANTITATIVE COMPOSITION
Composition
Olimel/PeriOlimel® are presented in the form of a 3-compartment bag. The individual compartments contain a glucose solution, a lipid emulsion and an amino acid solution (with/without electrolytes). In products containing electrolytes, calcium is included in the glucose solution compartment and other electrolytes are in the amino acid solution compartment. There are 5 different formulations of Olimel (3 with electrolytes and 2 without electrolytes) and one formulation of PeriOlimel. The general composition of the formulations are summarised below:

<table>

</tbody>
</table>

¹ prefixes N4, N5, N7, N9 refer to approx. nitrogen content in g/L.
² contains 17 amino acids (and electrolytes if present).
³ contains calcium if present.
⁴ contains refined olive oil (80%) and soya oil (20%).

For the detailed formulations, refer to Appendix 1.

For the full list of excipients, see section 6.1.

3 PHARMACEUTICAL FORM
Emulsion for infusion.

Appearance
Appearance before reconstitution:
• The amino acid and glucose solutions are clear and colourless or slightly yellow.
• The lipid emulsion is a homogeneous liquid with a milky appearance.

Appearance after reconstitution:
The mixture is a homogeneous emulsion with a milky appearance, see section 4.2.

Description
After reconstitution/mixing of the contents of the 3 compartments, Olimel/PeriOlimel® is a milk-like homogeneous liquid. The composition of the 3-in-1 admixture for each of the bag presentations are provided in Appendix 1.
**NEW ZEALAND DATA SHEET**

**Osmolarity**

*Olimel/PeriOlimel* are hypertonic emulsions. The osmolarity and energy contents of the formulations are as follows:

**4 CLINICAL PARTICULARS**

**4.1 Therapeutic indications**

*Olimel/PeriOlimel* is indicated for parenteral nutrition for adults when oral or enteral nutrition is impossible, insufficient, or contraindicated.

**4.2 Dose and method of administration**

For single use only. It is recommended that after opening the bag, the contents should be used immediately, and should not be stored for a subsequent infusion.

Due to its low osmolarity (760mOsm/L), *PeriOlimel* N4-600E can be administered through a peripheral or central vein. Due to its high osmolarity (1120 – 1360mOsm/L), *Olimel* N5-860E, N7-960E, N7-060, N9-840E, N9-840 must only be administered through a central vein.

Although there is a natural content of trace elements and vitamins in the product, the levels are insufficient to meet body requirements and these should be added to prevent deficiencies from developing.

**Adults**

The dosage depends on energy expenditure, the patient’s clinical status and ability to metabolise constituents of *Olimel/PeriOlimel*, as well as on additional energy or proteins given orally/enterally. Thus, the bag size should be then chosen with regard to the patient’s body weight.

The average daily requirements for adults are:

- **Protein**: 0.16 to 0.35g nitrogen/kg body weight (1 to 2g of amino acids/kg) depending on the patient’s nutritional status and degree of catabolic stress.
- **Energy**: 20 to 40kcal/kg.
- **Fluid**: 20 to 40mL fluid/kg, or 1 to 1.5mL per expended kcal.

The maximum daily dose should not be exceeded. Due to the static composition of the multi-chamber bag, the ability to simultaneously meet all nutrient needs of the patient may not be possible. Clinical situations may exist where patients require amounts of nutrients varying from the composition of the static bag. In this situation the impact of any volume (dose) adjustments must be taken into consideration and the resultant effect this will have on the dosing of all other nutrient components of *Olimel*.

The flow rate should be increased gradually during the first hour. The administration flow rate must be adjusted taking into account the dose being administered, the daily volume intake, and the duration of the infusion.
NEW ZEALAND DATA SHEET

The recommended duration of infusion for a parenteral nutrition bag is between 12 and 24 hours. Treatment with parenteral nutrition may be continued for as long as is required by the patient’s condition.

Method of preparation
Before opening the overpouch, check the colour of the oxygen indicator. Compare it to the reference colour printed next to the OK symbol and depicted in the printed area of the indicator label. Do not use the product if the colour of the oxygen indicator does not correspond to the reference colour printed next to OK symbol.

Preparation for administration
a) To open
   Remove the protective overpouch.
   Discard the oxygen absorber / oxygen indicator sachet.
   Confirm the integrity of the bag and of the non-permanent seals.

   Use only if the bag is not damaged, if the non-permanent seals are intact (i.e. no mixture of the contents of the three compartments), if the amino acids solution and the glucose solution are clear, colourless or slightly yellow, practically free of visible particles, and if the lipid emulsion is a homogeneous liquid with a milky appearance.

b) Mixing the solutions and the emulsion
   Ensure that the product is at room temperature when breaking the non-permanent seals.

   Manually roll the bag onto itself, starting at the top of the bag (hanger end). The non-permanent seals will disappear from the side near the inlets. Continue to roll until the seals are open along approximately half of their length.

   Mix by inverting the bag at least 3 times.

   After reconstitution, the mixture is a homogeneous emulsion with a milky appearance.

c) Additions
   The capacity of the bag is sufficient to enable additions such as vitamins, electrolytes and trace elements. Any addition (including vitamins) may be made into the reconstituted mixture (after the non-permanent seals have been opened and after the contents of the three compartments have been mixed). Vitamins may also be added into the glucose compartment before the mixture is reconstituted (before opening the non-permanent seals and before mixing the 3 compartments).

   When making additions to the formulation, the final osmolarity of the mixture should be measured before administration via a peripheral vein.

   When making additions to formulations containing electrolytes, the amount of electrolytes already present in the bag should be taken into account.

   Additions must be performed by qualified personnel under aseptic conditions.

   **PeriOlimel** N4-600E may be supplemented with electrolytes according to the following table:
### Additions to PeriOlimel N4-600E per 1000mL

(+) including phosphate provided by the lipid emulsion

**Trace elements and vitamins**

Stability has been demonstrated with commercially available preparations of vitamins and trace elements (containing up to 1mg of iron).
NEW ZEALAND DATA SHEET

To perform an addition:
- Aseptic conditions must be observed.
- Prepare the injection site of the bag.
- Puncture the injection site and inject the additives using an injection needle or a reconstitution device.
- Mix content of the bag and the additives.

d) Preparation of the infusion

Aseptic conditions must be observed.

Suspend the bag.

Remove the plastic protector from the administration outlet.

Firmly insert the spike of the infusion set into the administration outlet.

e) Administration

For single use only.

Only administer the product after the non-permanent seals between the three compartments have been broken and the contents of the three compartments have been mixed. Ensure that the final emulsion for infusion does not show any evidence of phase separation.

After opening the bag, the content must be used immediately, should not be stored for a subsequent infusion. Do not reconnect any partially used bag.

Do not connect in series in order to avoid the possibility of air embolism due to gas contained in the first bag.

Any unused product or waste material and all necessary disposable devices must be discarded.

4.3 Contraindications

Use of Olimel/PeriOlimel is contraindicated in the following situations:
- in premature neonates, infants and children less than 2 years old
- known hypersensitivity to egg or soya proteins, peanut protein, corn (maize) and corn products, components of the container, or to any of the ingredients including active substances and/or excipients
- congenital abnormalities of amino acid metabolism
- severe hyperlipidaemia or severe disorders of lipid metabolism characterised by hypertriglyceridaemia
- severe hyperglycaemia
- unstable conditions (for example, following severe post-traumatic conditions, acute phase of circulatory shock, acute myocardial infarction, severe sepsis and hyperosmolar coma)
- Olimel/PeriOlimel formulations with electrolytes must not be administered to patients with pathologically elevated plasma concentrations of sodium, potassium, magnesium, calcium and/or phosphorus.

Use with caution in patients with severe liver insufficiency, including cholestasis or elevated liver enzymes. Liver function parameters should be closely monitored.
4.4 Special warnings and precautions for use

The infusion must be stopped immediately if any signs or symptoms of an allergic reaction (such as fever, shivering, skin rashes or dyspnoea) develop.

Olimel/PeriOlimel contain glucose. Solutions containing glucose should be used with caution in patients with known allergy to corn or corn products.

Pulmonary vascular precipitates causing pulmonary vascular emboli and pulmonary distress have been reported in patients receiving parenteral nutrition. In some cases, fatal outcomes have occurred. Excessive addition of calcium and phosphate increases the risk of the formation of calcium phosphate precipitates. Precipitates have been reported even in the absence of phosphate salt in the solution. Suspected precipitate formation in the blood stream have also been reported.

In addition to inspection of the solution, the infusion set and catheter should also periodically be checked for precipitates.

If signs of pulmonary distress occur, the infusion should be stopped and medical evaluation initiated.

No additions to the bag should be made without first checking the compatibility, as formation of precipitates or destabilisation of the lipid emulsion could result in vascular occlusion (see section 4.5).

Infection and sepsis may occur as a result of the use of intravenous catheters to administer parenteral formulations, poor maintenance of catheters or contaminated solutions. Immunosuppression by medicines and other factors such as hyperglycaemia, malnutrition and/or their underlying disease state may predispose patients to infectious complications. Careful symptomatic and laboratory monitoring for fever/chills, leukocytosis, technical complications with the access device, and hyperglycaemia can help recognise early infections. The occurrence of septic complications can be decreased with heightened emphasis on aseptic technique in catheter placement, maintenance, as well as aseptic technique in nutritional formula preparation.

“Fat overload syndrome” has been reported with similar products. This may be caused by inappropriate administration (e.g. overdose and/or infusion rate higher than recommended, see section 4.9); however, the signs and symptoms of this syndrome may also occur when the product is administered according to instructions. The reduced or limited ability to metabolise the lipids contained in Olimel/PeriOlimel accompanied by prolonged plasma clearance may result in a fat overload syndrome. This syndrome is associated with a sudden deterioration in the patient’s clinical condition and is characterised by findings such as fever, anaemia, leucopenia, thrombocytopenia, coagulation disorders, hyperlipidaemia, liver fatty infiltration (hepatomegaly), deteriorating liver function, and central nervous system manifestations (e.g. coma). The syndrome is usually reversible when the infusion of the lipid emulsion is stopped.

Ceftriaxone must not be administered simultaneously with intravenous calcium-containing solutions, including Olimel/PeriOlimel, through the same infusion line (e.g., via Y-connector) because of the risk of precipitation of ceftriaxone-calcium salt.

If the same infusion line is used for sequential administration, the line must be thoroughly flushed with a compatible fluid between infusions.

Refeeding severely undernourished patients may result in the refeeding syndrome that is characterised by the shift of potassium, phosphorus and magnesium intracellularly as the patient becomes anabolic. Thiamine deficiency and fluid retention may also develop. Careful monitoring and
slowly increasing nutrient intakes while avoiding overfeeding can prevent these complications. This syndrome has been reported with similar products.

If the final mixture is hypertonic, it may cause irritation of the vein when administered into a peripheral vein.

While PeriOlimel N4-600E may be administered through a peripheral vein, thrombophlebitis may develop. The catheter insertion site must be monitored daily for local signs of thrombophlebitis.

Olimel N5-860E, N7-960, N7-960E, N9-840 or N9-840E must only be administered through a central vein.

Extravasation has been reported with the administration of Olimel/PeriOlimel.

Do not connect bags in series in order to avoid air embolism due to possible residual air contained in the primary bag.

Refer to sections 4.5 and 6.2.

Monitor water and electrolyte balance, serum osmolarity, serum triglycerides, acid/base balance, blood glucose, liver and kidney function, and blood count, including platelets and coagulation parameters throughout treatment.

In addition, regular clinical and laboratory tests are required particularly in cases of:

- amino acid metabolism disorders (see section 4.3)
- hepatic insufficiency because of the risk of developing or worsening neurological disorders associated with hyperammonaemia
- renal insufficiency, particularly if hyperkalaemia is present; risk of developing or worsening metabolic acidosis and hyperazotaemia if extra-renal waste removal is not being performed
- metabolic acidosis (administration of carbohydrates is not recommended in the presence of lactic acidosis)
- diabetes mellitus: monitoring of glucose concentrations, glucosuria, ketonuria and, where applicable, adjustment of insulin dosages
- coagulation disorders
- anaemia
- hyperlipidaemia (because of the presence of lipids in the emulsion for infusion).

The blood count and coagulation factors must be monitored more carefully during long-term administration (several weeks).

**Cardiovascular**

Use with caution in patients with pulmonary oedema or heart failure. Fluid status should be closely monitored.

**Endocrine and metabolism**

Metabolic complications may occur if the nutrient intake is not adapted to the patient’s requirements, or the metabolic capacity of any given dietary component is not accurately assessed. Adverse metabolic effects may arise from administration of inadequate or excessive nutrients or from inappropriate composition of an admixture for a particular patient’s needs.

Serum triglyceride concentrations and the ability of the body to metabolise lipids must be checked regularly. If a lipid metabolism abnormality is suspected, monitoring of serum triglycerides is recommended as clinically necessary.
NEW ZEALAND DATA SHEET

In the event of hyperglycaemia, the infusion rate of Olimel/PeriOlimel must be adjusted and/or insulin administered.

**Renal**
Use with caution in patients with renal insufficiency. Fluid and electrolyte status should be closely monitored in these patients.

Severe water and electrolyte equilibration disorders, severe fluid overload states, and severe metabolic disorders should be corrected before starting the infusion.

**Effects on laboratory tests**
The lipids contained in this emulsion may interfere with the results of certain laboratory tests (for example, bilirubin, lactate dehydrogenase, oxygen saturation, blood haemoglobin) if the blood sample is taken before the lipids are eliminated (these are generally eliminated after a period of 5 to 6 hours without receiving lipids).

4.5 Interaction with other medicines and other forms of interaction
No interaction studies have been performed with Olimel/PeriOlimel.

Do not add other medicinal products or substances to one of the three compartments of the bag or to the reconstituted solution/emulsion without firstly confirming their compatibility and the stability of the resulting preparation (in particular stability of the lipid emulsion or formation of precipitates).

As with any parenteral nutrition admixture, calcium and phosphate ratios must be considered. Excess addition of calcium and phosphate, especially in the form of mineral salts, may result in the formation of calcium phosphate precipitates.

Olimel/PeriOlimel must not be administered simultaneously with blood through the same infusion tubing because of the risk of pseudoagglutination.

Due to the risk of precipitation, Olimel/PeriOlimel should not be administered through the same infusion line or admixed together with ampicillin or fosphenytoin.

Olimel/PeriOlimel contains calcium ions which pose additional risk of coagulation precipitated in citrate anticoagulated/preserved blood or components. This only applies to products containing electrolytes.

Soya oil has a natural content of vitamin K1 that may counteract the anticoagulant activity of coumarin derivatives, including warfarin.

Due to the potassium content of Olimel/PeriOlimel (with electrolyte formulations), special care should be taken in patients simultaneously treated with potassium sparing diuretics with ACE inhibitors, angiotensin II receptor antagonists, or the immunosuppressants tacrolimus and cyclosporin in view of the risk of hyperkalaemia.

4.6 Fertility, pregnancy and lactation

**Fertility**
No studies have been conducted to assess the effects of Olimel/PeriOlimel on fertility.

**Pregnancy (Category - exempt)**
There are no adequate data on use of Olimel/PeriOlimel in pregnant women. Physicians should carefully consider the potential risks and benefits for each specific patient before prescribing Olimel/PeriOlimel.
**Lactation**
There are no adequate data on use of Olimel/PeriOlimel in lactating women. Following intravenous infusion, most of the active ingredients contained in Olimel/PeriOlimel are expected to be excreted in human milk and the safety of the breastfeeding infant has not been established. Physicians should carefully consider the potential risks and benefits for each specific patient before prescribing Olimel/PeriOlimel.

**4.7 Effects on ability to drive and use machines**
Olimel/PeriOlimel has no or negligible influence on the ability to drive and use machines.

**4.8 Undesirable effects**
The safety and clinical efficacy of Olimel N9-840 was assessed in one double-blind randomised study with an active control over five days. Twenty-eight patients with different medical conditions (post-surgery fasting, severe malnutrition, enteral intake insufficient or forbidden) were included in the Olimel group and received the medicine at up to 40mL/kg/day.

The investigator judged the following seven adverse reactions as related to Olimel:

<table>
<thead>
<tr>
<th>System Organ Class (SOC)</th>
<th>Preferred MedDRA Term</th>

<td>Hypertension</td>
</tr>
</tbody>
</table>

**Post-marketing experience**
The following adverse reactions have been reported in the Post-marketing experience, listed by MedDRA System Organ Class (SOC), then by Preferred Term in order of severity.

General disorders and administration site conditions:
Injection site extravasation, Pyrexia, Chills.

The following adverse reactions have been reported with other similar products:
- Fat overload syndrome,
- Cholestasis, Elevated liver enzymes and Azotaemia,
- Pulmonary vascular precipitates (pulmonary vascular emboli and pulmonary distress).

**Reporting of suspected adverse reactions**
Reporting suspected adverse reactions after authorisation of the medicine is important. It allows continuing monitoring of the benefit/risk balance of the medicine. Healthcare professionals are asked to report any suspected adverse reactions https://nzphv.otago.ac.nz/reporting/

**4.9 Overdose**
In the event of inappropriate administration (overdose and/or infusion rate higher than recommended), nausea, vomiting, chills, headache, hot flush, hyperhidrosis and electrolyte disturbances and signs of hypervolaemia or acidosis may occur and result in severe or fatal
consequences. In such situations the infusion must be stopped immediately. If medically appropriate, further intervention may be indicated.

Hyperglycaemia, glucosuria, and hyperosmolar syndrome may develop if glucose infusion rate exceeds clearance.

In some serious cases, haemodialysis, haemofiltration, or haemodiafiltration may be necessary.

The reduced or limited ability to metabolise lipids may result in fat overload syndrome, the results of which are usually reversible after infusion of the lipid emulsion is stopped.

For advice on the management of overdose please contact the National Poisons Centre on phone number: 0800 764 766 [0800 POISON] in New Zealand (or 131126 in Australia).

5 PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group

Solutions for parenteral nutrition/mixtures.

ATC code

B05 BA 10.

Pharmacological actions

This is a 3-in-1 admixture enabling the nitrogen/energy balance to be maintained from the nitrogen source (L series amino acids) and energy in the form of glucose and essential fatty acids. Nitrogen and energy are required for normal functioning of all cells in the body, and are important for protein synthesis, growth, wound healing, immune function, muscle function, any other cellular activities.

The amino acids solution contains 17 amino acids (including 8 essential amino acids), which are required for protein synthesis. Amino acids also represent an energy source, their oxidation resulting in excretion of nitrogen in the form of urea. The amino acids profile is as follows:

- Essential amino acids/total amino acids: 44.8%.
- Branched-chain amino acids/total amino acids: 18.3%.

The formulations without electrolytes allow individual electrolyte intake to be adapted to meet specific requirements.

The lipid emulsion included in Olimel/PeriOlimel, is an association of refined olive oil and refined soya oil (ratio 80/20), with the following approximate distribution of fatty acids:

- 15% saturated fatty acids (SFA)
- 65% monounsaturated fatty acids (MUFA)
- 20% polyunsaturated essential fatty acids (PUFA).

The phospholipid/triglyceride ratio is 0.06. The moderate essential fatty acid (EFA) content improves the status of their upper derivatives while correcting EFA deficiency.

Olive oil contains significant amounts of alpha-tocopherol, when combined with a moderate PUFA intake, contributes to improve vitamin E status and reduce lipid peroxidation.

The carbohydrate source is glucose. Glucose is the primary source of energy in the body.

Clinical efficacy and safety
Study ICS1063B/P01/03/Mu. F was a prospective randomised double-blind multicenter study performed in fifty six hospitalized patients (age range 18 – 85 years) to evaluate safety and nutritional efficacy of Olimel N9-840 compared to OliClinomel N8-800 (not registered in New Zealand or Australia) but contains the same ingredients as the OliClinomel products registered in NZ). The study was conducted in a variety of patients (primarily post-surgery and trauma) who required balanced parenteral nutrition representing at least 50% of the daily nonprotein energy requirements for 5 days. The primary nutritional efficacy endpoint was transthyretin (pre-albumin) levels. Safety was evaluated using adverse events, vital signs, and biochemical markers for renal (urea, creatinine), hepatic (AST, ALT, alkaline phosphatase, GGT, bilirubin), haematologic (RBC count, haemoglobin, haematocrit, platelets, WBCs, lymphocytes, neutrophils, monocytes, eosinophils, basophils), organ functions as well as glucose and lipid parameters (triglycerides, cholesterol).
Efficacy analysis on the per protocol (PP) and intent-to-treat (ITT) populations showed no difference between the Olimel and OliClinomel groups on the primary endpoint (transthyretin), which improved from baseline to Day 5/end of treatment.

</tr>
</tbody>
</table>

EOT: End of treatment. SD: Standard deviation.

The safety of the two formulations was comparable. There was no difference between the treatment groups for any clinical laboratory or vital sign parameters evaluated during the study.

5.2 Pharmacokinetic properties
The ingredients of the emulsion for infusion (amino acids, glucose and lipids) are distributed, metabolised and eliminated in the same way as if they had been administered individually.

The pharmacokinetic properties of the amino acids administered intravenously are principally the same as those of amino acids supplied by oral feeding. Amino acids from food proteins, however, first pass through the portal vein before reaching the systemic circulation.

The elimination rate of lipid emulsions depends on particle size. Small lipid particles appear to delay clearance whereas they increase lipolysis by lipoprotein lipase. Most of the lipid particle sizes are in the range of chylomicrons (0.08 – 0.6 micrometers) with the mean diameter of less than 0.35 micrometers. However, it may contain a small fraction (up to 2.5%) of particles having a diameter of more than 0.75 micrometer.

5.3 Preclinical safety data
No genotoxicity/carcinogenicity studies have been conducted with Olimel/PeriOlimel.

6 PHARMACEUTICAL PARTICULARS
6.1 List of excipients
Olimel/PeriOlimel also contains the following excipients:
- Egg lecithin (purified egg phosphatide),
- Glycerol,
- Sodium oleate,
- Sodium hydroxide/Glacial acetic acid/Hydrochloric acid (for pH adjustment), and
- Water for injections.

6.2 Incompatibilities
Do not add other medicinal products or substances to one of the three components of the bag or to the reconstituted emulsion without first confirming their compatibility and the stability of the resulting preparation (in particular, stability of the lipid emulsion).
6.3 Shelf life
24 months from date of manufacture (stored at or below 25°C).

After reconstitution
7 days reconstituted stored at 2°C to 8°C (Refrigerate, do not freeze).
48 hours reconstituted stored at or below 25°C.

6.4 Special precautions for storage
Store below 25°C. Do not freeze. Store in overpouch.

After reconstitution
It is recommended that the product be used immediately after the non-permanent seals between the three compartments have been opened. However, the stability of the reconstituted emulsion has been demonstrated for 7 days (between 2°C and 8°C) followed by 48 hours at temperature not exceeding 25°C.

After addition of supplements (electrolytes, trace elements and vitamins)
See section 4.2. For specific admixtures, chemical and physical in-use stability has been demonstrated for 7 days (between 2°C and 8°C) followed by 48 hours at temperature not exceeding 25°C.

From a microbiological point of view, any admixture should be used immediately. If not used immediately, in-use storage times and conditions, after mixing and prior to use, are the responsibility of the user and would normally not be longer than 24 hours at 2°C to 8°C.

6.5 Nature and contents of container
The three-compartment bag is a multi-layer plastic bag. The inner (contact) layer of the bag is made of a blend of polyolefinic copolymers and is compatible with amino acid solutions, glucose solutions and lipid emulsions. Other layers are made of poly-ethylene vinyl acetate (EVA) and of copolyester.

The glucose compartment is fitted with an injection site to be used for addition of supplements. The amino acid compartment is fitted with an administration site for insertion of the spike of the infusion set.

The bag is packaged in an oxygen barrier overpouch which contains an oxygen absorber/oxygen indicator sachet.

* Mixture of refined olive oil (approximately 80%) and refined soya-bean oil (approximately 20%), corresponding to a ratio essential fatty acids / total fatty acids of 20%. The soya oil ingredient may contain ascorbyl palmitate as an antioxidant in the concentration ≤ 0.15mg/g of soya oil.
After the contents of the three compartments have been mixed, the 3-in-1 admixture for each of the bag presentations provides the following:
