What is in this leaflet

Read this leaflet carefully before taking your medicine.
Ask your doctor or pharmacist if you do not understand anything or are worried about taking your medicine.
This leaflet answers some common questions about prazosin.
It does not contain all the available information.
It does not take the place of talking to your doctor or pharmacist.
The information in this leaflet was last updated on the date listed on the last page. Some more recent information on the medicine may be available. Speak to your pharmacist or doctor to obtain the most up to date information on the medicine.
All medicines have risks and benefits. Your doctor has weighed the risks of you using this medicine against the benefits they expect it will have for you.
Keep this leaflet with the medicine. You may want to read it again.

What this medicine is used for

The name of your medicine is Apo-Prazosin. It contains the active ingredient, prazosin (as prazosin hydrochloride).

It is used to treat:
• high blood pressure (hypertension)
• prostate problems, such as benign prostatic hyperplasia (BPH) in men waiting for prostate surgery
• Raynaud's disease, where the fingers become white and very painful when cold
• certain types of heart failure.

Ask your doctor if you have any questions about why this medicine has been prescribed for you. Your doctor may have prescribed this medicine for another reason.
This medicine is available only with a doctor's prescription.

How it works

Prazosin works by relaxing the muscles in the walls of blood vessels and making it easier for blood to flow. They also relax the muscles in the prostate gland and increase the flow of urine.
When used to treat high blood pressure or heart failure, prazosin is often used together with other medicines.
There is no known evidence to show that this medicine is addictive.

Use in children

There is not enough information to recommend the use of this medicine in children.

Before you start to take it

Before you start taking this medicine, tell your doctor if:
1. You have allergies to:
• any other medicines
• any other substances, such as foods, preservatives or dyes.
2. You have or have had any medical conditions, especially the following:
• heart problems such as heart failure or angina or recent heart attack
• kidney or liver problems.
3. You are currently pregnant or plan to become pregnant.
Do not take this medicine whilst pregnant until you and your doctor have discussed the risks and benefits involved.

4. You are currently breastfeeding or plan to breastfeed.
   Prazosin may appear in breast milk. Do not take this medicine whilst breastfeeding until you and your doctor have discussed the risks and benefits involved.

5. You are planning to have cataract surgery.
   If you are taking or have previously taken prazosin, then the eye surgeon needs to be aware of this so he can be extra careful to avoid complications during the operation.

6. You are planning to have surgery or an anaesthetic.

7. You are currently receiving or are planning to receive dental treatment.

8. You are taking or are planning to take any other medicines. This includes vitamins and supplements that are available from your pharmacy, supermarket or health food shop.

**Taking other medicines**

Some medicines may interact with prazosin. These include:

- medicines used to lower blood pressure or for other heart conditions
- fluid tablets (diuretics), also used to lower blood pressure
- medicines to treat impotence (erectile dysfunction).

If you are taking any of these, you may need a different dose or you may need to take different medicines. Your doctor and pharmacist can tell you if you are taking any of these medicines. They may also have more information on medicines to be careful with or avoid while taking prazosin.

Other medicines not listed above may also interact with prazosin.

---

**How to take this medicine**

Follow carefully all directions given to you by your doctor. Their instructions may be different to the information in this leaflet.

**How much to take**

Your doctor will tell you how much of this medicine you should take. This will depend on your condition and whether you are taking any other medicines.

Do not stop taking your medicine or change your dosage without first checking with your doctor.

Prazosin is usually started at a low dose of 0.5 mg (half a 1mg tablet). Your doctor may gradually increase this dose as required. Starting with a low dose reduces the risk of too great a drop in your blood pressure which can make you dizzy, light-headed or faint.

**Hypertension (high blood pressure):**

The usual starting dose is 0.5 mg twice a day, increasing to 1 mg two or three times a day. Your doctor may increase this up to 20 mg a day, taken as divided doses.

**Heart failure:**

The usual starting dose is 0.5 mg increasing to 4 mg a day, divided into three or four doses. This may be increased by your doctor up to 20 mg a day, taken in divided doses.

**Raynaud's disease:**

The usual starting dose is 0.5 mg twice a day. Your doctor may increase this up to 1 mg or 2 mg twice a day.

**Benign prostatic hyperplasia (BPH):**

The usual starting dose is 0.5 mg twice a day. Your doctor may increase this gradually up to a maximum of 2 mg twice a day.

---

**How to take it**

Swallow the tablets with a glass of water. The tablets can be broken in half, if your doctor has prescribed this.

**When to take it**

Take this medicine at the same time each day. Taking this medicine at the same time each day will have the best effect and will also help you remember when to take it.

Take your very first dose last thing at night, just before going to bed. Be very careful if you need to get up during the night, because you may feel dizzy and could fall.

If your doctor increases your dose, take the first of that increased dose last thing at night. Again, be especially careful if you have to get up in the night.

It does not matter if you take it before, with or after food.

**How long to take it for**

Prazosin helps control your condition but does not cure it. Therefore, you must take your medicine every day.

If you are taking prazosin for high blood pressure, heart failure or Raynaud's disease, you may need to take it for a long time.

If you are taking prazosin for prostate problems, you will only have to take it until your operation.

Continue taking your medicine for as long as your doctor tells you.

Make sure you have enough to last over weekends and holidays.

**If you forget to take it**

If it is almost time for your next dose (within 3 hours), skip the dose you missed and take your next dose when you are meant to.

Otherwise, take it as soon as you remember, and then go back to taking your medicine as you would normally.
Do not take a double dose to make up for missed doses. This may increase the chance of you getting an unwanted side effect.

If you miss two doses or more, you will need to restart at a low dose and build up again gradually to your usual dose.

Ask your doctor how to do this. If you are not sure what to do, ask your doctor or pharmacist.

If you have trouble remembering to take your medicine, ask your pharmacist for some hints to help you remember.

If you take too much (overdose)

Immediately telephone your doctor or the National Poisons Information Centre (0800 POISON or 0800 764 766) for advice or go to Accident and Emergency at the nearest hospital, if you think that you or anyone else may have taken too much prazosin.

Do this even if there are no signs of discomfort or poisoning.

You may need urgent medical attention.

If you take too much prazosin, you may feel lightheaded, dizzy, have a fast or irregular heartbeat, or you may faint.

These symptoms can be dangerous, especially in people aged 65 years or older with heart or blood vessel disease.

If you feel dizzy or light-headed, lie down so that you do not faint, then sit for a few moments before standing to prevent the dizziness from returning. Make sure the area around you is clear so that you do not injure yourself if you fall.

If these symptoms continue, tell your doctor.

A change in your dose may be needed.

See your doctor immediately if you experience painful erections or if your erection continues for longer than four hours.

Tell your doctor that you are taking this medicine if:

- you are about to be started on any new medicine
- you are pregnant or are planning to become pregnant
- you are breastfeeding or are planning to breast-feed
- you are about to have any blood tests or urine tests
- you are going to have surgery or an anaesthetic or are going into hospital. You are about to have eye surgery (for example cataract surgery)

Your doctor may occasionally do tests to make sure the medicine is working and to prevent side effects.

Go to your doctor regularly for a check-up.

Tell any other doctors, dentists, and pharmacists who are treating you that you are taking this medicine.

Things to be careful of

Be careful driving or operating machinery until you know how prazosin affects you.

Prazosin may cause dizziness, light-headedness or fainting in some people, especially after the first dose or a dose increase. Blurred vision or drowsiness may also occur. Make sure you know how you react to prazosin before you drive a car, operate machinery, or do anything else that could be dangerous if you are dizzy, light-headed or not alert. If this occurs do not drive.

Limit the amount of alcohol you drink while taking prazosin.

Combining prazosin with alcohol can make you more dizzy or light-headed.

Make sure you drink enough water in hot weather, during exercise and when you have to stand for long periods of time, while you are taking prazosin. This is because dizziness, light-headedness and fainting are more likely to occur in these situations.

If you continue to feel unwell, tell your doctor.

Side effects

Tell your doctor as soon as possible if you do not feel well while you are taking prazosin or if you have any questions or concerns.

Do not be alarmed by the following list of side effects. You may not experience any of them. All medicines can have side effects. Sometimes they are serious, but most of the time they are not.

If you are 65 years or older, you should be especially careful while taking prazosin. Report any side effects promptly to your doctor.
Tell your doctor if you notice any of the following:

- nausea, vomiting, feeling sick
- dry mouth
- constipation or diarrhoea
- weakness, lack of energy
- headache
- drowsiness
- pain or fever
- hair loss or thinning
- poor bladder control
- impotence
- painful joints
- ringing in the ears (tinnitus)
- stuffy nose
- problems getting to sleep
- breast enlargement

Tell your doctor immediately if you notice any of the following:

These may be serious side effects and you may need medical attention:

- dizziness, spinning sensation or light-headedness when standing up
- fast or pounding heart beat
- skin problems such as rash, itching or hives
- blurred vision or painful or red eyes
- painful, continual erection
- tingling or numbness in the hands or feet
- swelling of the hands, feet or ankles
- feelings of nervousness or depression

If you experience any of the following, stop taking your medicine and contact your doctor immediately or go to the Accident and Emergency department at your nearest hospital.

These are very serious side effects and you may need urgent medical attention or hospitalisation

- sharp pain in the stomach or back
- fast or slow heart beat

Other side effects not listed above may occur in some patients.

**Allergic reactions**

If you think you are having an allergic reaction to prazosin, do not take any more of this medicine and tell your doctor immediately or go to the Accident and Emergency department at your nearest hospital.

Symptoms of an allergic reaction may include some or all of the following:

- cough, shortness of breath, wheezing or difficulty breathing
- swelling of the face, lips, tongue, throat or other parts of the body
- rash, itching or hives on the skin
- fainting
- hay fever-like symptoms.

**Storage and disposal**

**Storage**

Keep your medicine in its original packaging until it is time to take it.

If you take your medicine out of its original packaging it may not keep well.

Keep your medicine in a cool dry place where the temperature will stay below 25°C. Protect it from light.

Do not store your medicine, or any other medicine, in the bathroom or near a sink. Do not leave it on a window sill or in the car.

Heat and dampness can destroy some medicines.

**Keep it where children cannot reach it.**

A locked cupboard at least one-and-a-half metres above the ground is a good place to store medicines.

**Disposal**

If your doctor or pharmacist tells you to stop taking this medicine or it has passed its expiry date, ask your pharmacist what to do with any medicine that is left over.

**Product description**

**What it looks like**

Apo-Prazosin 1mg tablets: White, capsule-shaped tablets, flat-faced, bevelled edge tablet. Scored & engraved APO P1 on one side, other side plain.

Apo-Prazosin 2mg tablets: White, round, biconvex tablet. Scored & engraved APO over P2 on one side, other side plain.

Apo-Prazosin 5mg tablets: White, diamond-shaped, biconvex tablet. Scored & engraved APO over P5 on one side, other side plain.

Available in blister packs of 100, 500, 1000 tablets and bottles of 100, 500 and 1000 tablets.

Not all strengths, pack types and/or pack sizes may be available.

**Ingredients**

**Active Ingredient:**

Each tablet contains either 1mg, 2mg and 5mg of prazosin hydrochloride.

This medicine also contains the following inactive ingredients:

- Croscarmellose sodium
- Magnesium stearate
- Microcrystalline cellulose
- Polysorbate 80 NF
- Lactose monohydrate

Colouring for 1mg:

- Quinoline yellow
- Sunset yellow
This medicine is glucose free but contains lactose.
