

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### 1. PRODUCT NAME

Mekinist 0.5 mg film coated tablet

Mekinist 2 mg film coated tablet

### 2. QUALITATIVE AND QUANTITATIVE COMPOSITION

#### Mekinist 0.5 mg film coated tablet

Each film coated tablet contains trametinib dimethyl sulfoxide equivalent to trametinib 500 microgram.

#### Mekinist 2 mg film coated tablet

Each film coated tablet contains trametinib dimethyl sulfoxide equivalent to trametinib 2 mg.

#### **Excipients**

For the full list of excipients, see section 6.1.

### 3. PHARMACEUTICAL FORM

Film-coated tablet

#### Mekinist 0.5 mg film coated tablet

Yellow, modified oval, biconvex, film-coated tablets with 'GS' debossed on one face and 'TFC' on the opposing face.

#### Mekinist 2 mg film coated tablet

Pink, round, biconvex, film-coated tablets with 'GS' debossed on one face and 'HMJ' on the opposing face.

### 4. CLINICAL PARTICULARS

#### 4.1 Therapeutic Indications

##### Unresectable or metastatic melanoma

MEKINIST in combination with dabrafenib is indicated for the treatment of patients with BRAFV600 mutation positive unresectable Stage III or metastatic (Stage IV) melanoma.

MEKINIST as a monotherapy is indicated for the treatment of patients with BRAFV600 mutation positive unresectable Stage III or metastatic (Stage IV) melanoma and in whom either there is intolerance to BRAF inhibitors or BRAF inhibitors cannot be used.

MEKINIST as monotherapy has not demonstrated clinical activity in patients who have progressed on BRAF inhibitor therapy (see section 5.1).

##### Adjuvant treatment of melanoma

MEKINIST in combination with Tafinlar is indicated for the adjuvant treatment of patients with Stage III melanoma with a BRAF V600 mutation, following complete resection.

##### Anaplastic thyroid cancer (ATC)

MEKINIST in combination with dabrafenib is indicated for the treatment of patients with locally advanced or metastatic anaplastic thyroid cancer (ATC) with a BRAF V600 mutation.

##### Non-small cell lung cancer (NSCLC)

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

MEKINIST in combination with dabrafenib is indicated for the treatment of patients with advanced non-small cell lung cancer (NSCLC) with a BRAF V600 mutation.

### 4.2 Dose and method of administration

Treatment with MEKINIST should only be initiated and supervised by a physician experienced in the use of anti-cancer medicinal products.

Confirmation of BRAF V600 mutation using an approved/validated test is required, for selection of patients appropriate for MEKINIST monotherapy and in combination with dabrafenib (see section 5.1).

When MEKINIST is used in combination with dabrafenib, refer to section 4.2 Dosage and Administration in the full TAFINLAR Data Sheet for dabrafenib dosing instructions.

#### **Dose**

##### Adult

The recommended dose of MEKINIST used as monotherapy or in combination with dabrafenib is 2 mg given orally once daily.

Dose modifications

##### *Monotherapy and in combination with dabrafenib*

The management of adverse events/adverse drug reactions may require treatment interruption, dose reduction, or treatment discontinuation (see Table 1 and Table 2).

**Table 1 Recommended MEKINIST dose level reductions**

<b>Dose Level</b>	<b>MEKINIST dose</b>
Starting dose	2 mg once daily
1st dose reduction	1.5 mg once daily
2nd dose reduction	1 mg once daily

Dose adjustment for MEKINIST, below 1 mg once daily is not recommended, whether used as monotherapy or in combination with dabrafenib.

**Table 2 MEKINIST dose modification schedule**

<b>Grade (CTC-AE)*</b>	<b>Dose Modifications</b>
Grade 1 or Grade 2 (Tolerable)	Continue treatment and monitor as clinically indicated.
Grade 2 (Intolerable) or Grade 3	Interrupt therapy until toxicity is grade 0-1 and reduce by one dose level when resuming therapy.
Grade 4	Discontinue permanently, or interrupt therapy until Grade 0 to 1 and reduce by one dose level when resuming therapy

\* The intensity of clinical adverse events graded by the Common Terminology Criteria for Adverse Events v4.0 (CTC-AE)

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

When an individual's adverse reactions are under effective management, dose re-escalation following the same dosing steps as de-escalation may be considered. The MEKINIST dose should not exceed 2 mg once daily.

If treatment related toxicities occur when MEKINIST is used in combination with dabrafenib then both treatments should be simultaneously dose reduced, interrupted or discontinued with the exceptions shown below.

Exceptions where dose modifications are necessary for only MEKINIST:

- Left ventricular ejection fraction (LVEF) reduction
- Retinal vein occlusion (RVO) and retinal pigment epithelial detachment (RPED)
- Interstitial lung disease (ILD)/Pneumonitis

*Detailed dosing modifications for selected adverse reactions*

### *New Primary Malignancies*

For New Primary Cutaneous Malignancies no dose modifications are required. For New Primary Non-Cutaneous Malignancies no dose modifications are required for MEKINIST. If used in combination with dabrafenib, permanently discontinue dabrafenib in patients who develop RAS mutation-positive non-cutaneous malignancies.

### *Haemorrhagic events*

Permanently discontinue MEKINIST, and also permanently discontinue dabrafenib if administered in combination, for all Grade 4 haemorrhagic events and for any Grade 3 haemorrhagic events that do not improve. Withhold MEKINIST for up to 3 weeks for Grade 3 haemorrhagic events; if improved resume at a lower dose level. Withhold dabrafenib for Grade 3 haemorrhagic events; if improved resume at a lower dose level.

### *Pyrexia Management*

Pyrexia may occur with MEKINIST monotherapy and when MEKINIST is used in combination with dabrafenib. Initiate treatment with anti-pyretics such as ibuprofen (preferred) or paracetamol. The use of oral corticosteroids should be considered in those instances in which anti-pyretics are insufficient. Patients should be evaluated for signs and symptoms of infection (see section 4.4). Follow the management given in Table 3.

**Table 3 Recommended MEKINIST dose modifications in pyrexia management**

<b>Patient's temperature</b>	<b>MEKINIST monotherapy</b>	<b>MEKINIST combination therapy with dabrafenib</b>
38.5°C - 40°C	Do not modify the MEKINIST dose	Do not modify the MEKINIST dose. Withhold dabrafenib.  Upon resolution of pyrexia, resume dabrafenib with appropriate anti-pyretic prophylaxis either at the same dose level, or reduce dabrafenib one dose level, if pyrexia is recurrent.
> 40°C or if fever is complicated by rigors, hypotension, dehydration, or renal failure	Withhold MEKINIST until fever resolves.  Upon resolution of pyrexia, resume MEKINIST at same or lower dose level.	Withhold MEKINIST and dabrafenib. Initiate treatment with anti-pyretics such as ibuprofen (preferred) or paracetamol.  Upon resolution of pyrexia, resume therapy with appropriate anti-pyretic prophylaxis with: <ul style="list-style-type: none"><li>• MEKINIST at the same or at a lower dose level and</li></ul>

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

Patient's temperature	MEKINIST monotherapy	MEKINIST combination therapy with dabrafenib
		<ul style="list-style-type: none"> <li>dabrafenib at either a lower dose level or permanently discontinue dabrafenib</li> </ul>

### *LVEF Reduction/Left Ventricular Dysfunction management*

MEKINIST should be interrupted in patients who have an asymptomatic, absolute decrease of  $\geq 10\%$  in LVEF compared to baseline and the ejection fraction is below the institution's lower limit of normal (LLN) (see section 4.4). If MEKINIST is being used in combination with dabrafenib then therapy with dabrafenib may be continued at the same dose. If the LVEF recovers, treatment with MEKINIST may be restarted, but reduce dose by one dose level with careful monitoring.

Permanently discontinue MEKINIST with Grade 3 or 4 left ventricular cardiac dysfunction or if LVEF reduction does not recover. If MEKINIST is being used in combination with dabrafenib then therapy with dabrafenib should be withheld and resumed at the same dose upon recovery of cardiac function.

### *Retinal Vein Occlusion (RVO) and Retinal Pigment Epithelial Detachment (RPED) management*

If patients report new visual disturbances such as diminished central vision, blurry vision, or loss of vision at any time while on MEKINIST therapy, a prompt ophthalmological assessment is recommended. In patients who are diagnosed with retinal vein occlusion (RVO), treatment with MEKINIST, whether given as monotherapy or in combination with dabrafenib, should be permanently discontinued. Dabrafenib treatment can continue at the same dose.

If retinal pigment epithelial detachment (RPED) is diagnosed, follow the dose modification schedule in Table 4 for MEKINIST and continue dabrafenib at the same dose (see section 4.4).

**Table 4 Recommended dose modifications for MEKINIST for retinal pigment epithelial detachments (RPED)**

Grade	Recommended dose modifications for Mekinist
Grade 1 RPED	Continue treatment with retinal evaluation monthly until resolution. If RPED worsens follow instructions below and withhold MEKINIST for up to 3 weeks
Grade 2-3 RPED	Withhold MEKINIST for up to 3 weeks
Grade 2-3 RPED that improves to Grade 0-1 within 3 weeks	Resume MEKINIST at a lower dose (reduced by 0.5 mg) or discontinue MEKINIST in patients taking MEKINIST 1 mg daily
Grade 2-3 RPED that does not improve to at least Grade 1 within 3 weeks	Permanently discontinue MEKINIST

### *Interstitial lung disease (ILD)/Pneumonitis management*

Follow the dose modification guidelines in Table 9 for MEKINIST.

If MEKINIST is used in combination with dabrafenib, do not modify the dose of dabrafenib. Refer to the full Data Sheet of dabrafenib for dose modification guidelines (see section 4.2).

### *Serious Skin Toxicity*

For dosing instructions for intolerable or severe skin toxicity for MEKINIST and MEKINIST in combination with dabrafenib see Table 5. Dose reduction, interruption or discontinuation should be applied to both treatments.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

**Table 5 Guidelines for Cutaneous toxicity**

Severity of Adverse Reaction	MEKINIST	Dabrafenib (When Used in Combination)
<ul style="list-style-type: none"> <li>Intolerable Grade 2 skin toxicity</li> <li>Grade 3 or 4 skin toxicity</li> </ul>	Withhold MEKINIST for up to 3 weeks. <ul style="list-style-type: none"> <li>If improved, resume at a lower dose level.</li> <li>If not improved, permanently discontinue.</li> </ul>	Withhold dabrafenib for up to 3 weeks. <ul style="list-style-type: none"> <li>If improved, resume at a lower dose level.</li> <li>If not improved, permanently discontinue.</li> </ul>

The following rash management guidance should be considered whether MEKINIST is given as monotherapy or in combination with dabrafenib, and if dose reduction, interruption or discontinuation is necessary it should be applied to both treatments.

Treatment of rash has not been formally studied and should be based on rash severity. The following guidelines were used in clinical studies with MEKINIST as monotherapy or in combination with dabrafenib and can be used to manage rash (see Table 6).

**Table 6 Supportive Care Guidelines for Rash**

Step	Rash Grade	Rash severity	Management of Rash
1	Mild	Localised Minimally symptomatic No impact on ADL No sign of superinfection	Initiate prophylactic regimen <sup>a</sup> if not already started.  Reassess after two weeks; if rash worsens or does not improve, proceed to step 2
2	Moderate	Generalised Mild symptoms (e.g. pruritus, tenderness) Minimal impact on ADL No sign of superinfection	Initiate prophylactic regimen <sup>a</sup> if not already started, using moderate strength topical steroids.  Reassess after two weeks; if rash worsens or does not improve, proceed to step 3
3	Severe	Generalised Severe symptoms (e.g. pruritus, tenderness) Significant impact on ADL Sign of or potential for superinfection	Initiate prophylactic regimen <sup>a</sup> if not already started, using moderate strength topical steroids PLUS systemic corticosteroids.  Manage rash per dermatologist's recommendation.

<sup>a</sup> broad-spectrum sunscreen (skin protection factor  $\geq 15$ ), alcohol-free emollient cream, mild-strength topical steroid, and oral antibiotics for first 2-3 weeks

ADL= Activity of Daily Living

### Special populations

#### *Paediatric patients (< 18 years of age)*

The safety and efficacy of MEKINIST has not been yet established in children and adolescents (< 18 years).

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### *Patients > 65 years of age*

No dose adjustments are required in patients over 65 years (see section 5.2).

### *Renal impairment*

No dosage adjustment required in patients with mild or moderate renal impairment. Mild or moderate renal impairment had no significant effect on the population pharmacokinetics of MEKINIST (see section 5.2). There are no clinical data with MEKINIST in patients with severe renal impairment; therefore, the potential need for starting dose adjustment cannot be determined. MEKINIST should be used with caution in patients with severe renal impairment.

### *Hepatic impairment*

No dosage adjustment is required in patients with mild hepatic impairment. In a population pharmacokinetic analysis, MEKINIST oral clearance and thus exposure was not significantly different in patients with mild hepatic impairment compared to patients with normal hepatic function (see section 5.2).

There are no clinical data in patients with moderate or severe hepatic impairment; therefore, the potential need for starting dose adjustment cannot be determined. MEKINIST should be used with caution in patients with moderate or severe hepatic impairment.

### **Administration**

MEKINIST should be taken without food, at least one hour before or two hours after a meal (see section 5.2).

When MEKINIST and dabrafenib are taken in combination, the dose of MEKINIST should be taken at the same time each day with either the morning dose or the evening dose of dabrafenib.

Swallow the MEKINIST tablet whole with a full glass of water.

If a dose of MEKINIST is missed, only take the dose if it is more than 12 hours until the next scheduled dose.

### **4.3 Contraindications**

Hypersensitivity to the active substance trametinib dimethyl sulfoxide or any of the excipients listed in section 6.1.

### **4.4 Special warnings and precautions for use**

When MEKINIST is given in combination with dabrafenib, the data sheet of dabrafenib must be consulted prior to initiation of treatment. For additional information on warnings and precautions associated with dabrafenib treatment, please refer to the dabrafenib data sheet.

#### BRAF V600 testing

Confirmation of BRAF V600 mutation using an approved/validated test is required for selection of patients appropriate for MEKINIST monotherapy and in combination with dabrafenib. Patients enrolled in the melanoma clinical studies were required to have BRAF V600 mutation status measured. The safety and efficacy of MEKINIST have not been evaluated in patients whose melanoma tested negative for the BRAF V600 mutation.

#### New primary malignancies

New primary malignancies can occur when MEKINIST is used in combination with dabrafenib and with dabrafenib as a single agent [refer to Full Data Sheet for dabrafenib].

Based on its mechanism of action, dabrafenib may promote growth and development of malignancies with activation of RAS through mutation or other mechanisms (refer to the Product Information for dabrafenib).

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### Non-Cutaneous secondary/ recurrent malignancies

In patients receiving MEKINIST in combination with dabrafenib, four cases of non-cutaneous malignancies were identified: KRAS mutation-positive pancreatic adenocarcinoma (n = 1), recurrent NRAS mutation-positive colorectal carcinoma (n = 1), head and neck carcinoma (n = 1), and glioblastoma (n = 1). Monitor patients receiving the combination closely for signs or symptoms of non-cutaneous malignancies. If used in combination with dabrafenib, no dose modification is required for MEKINIST in patients who develop non-cutaneous malignancies. Permanently discontinue dabrafenib in patients who develop RAS mutation-positive non-cutaneous malignancies (see section 4.2).

### Haemorrhage

Haemorrhagic events, including major haemorrhages, defined as symptomatic bleeding in a critical area or organ, have occurred in patients taking MEKINIST as monotherapy and in combination with dabrafenib (see section 4.8).

Out of the 559 unresectable or metastatic melanoma patients receiving MEKINIST in combination with dabrafenib in phase III trials, there were six fatal intracranial haemorrhagic events (1 %). No fatal haemorrhagic events occurred in the Phase III study in the adjuvant treatment of melanoma. Two out of 93 patients (2%) receiving MEKINIST in combination with Tafinlar in a Phase II NSCLC trial had fatal intracranial haemorrhagic events. If patients develop symptoms of haemorrhage they should immediately seek medical care.

Three cases were from study MEK115306 (COMBI-d) and three cases were from study MEK116513 (COMBI-v). If patients develop symptoms of haemorrhage they should immediately seek medical care.

In Study BR113220, treatment with MEKINIST in combination with dabrafenib resulted in an increased incidence and severity of any haemorrhagic event: 16% (9/55) of patients treated with MEKINIST in combination with dabrafenib compared with 2% (1/53) of patients treated with dabrafenib as a single agent. The major haemorrhagic events of intracranial or gastric haemorrhage occurred in 5% (3/55) of patients treated with MEKINIST in combination with dabrafenib compared with none of the 53 patients treated with dabrafenib as a single agent. Intracranial haemorrhage was fatal in two (4%) patients receiving the combination of MEKINIST and dabrafenib.

Permanently discontinue MEKINIST, and also permanently discontinue dabrafenib if administered in combination, for all Grade 4 haemorrhagic events and for any Grade 3 haemorrhagic events that do not improve. Withhold MEKINIST for up to 3 weeks for Grade 3 haemorrhagic events; if improved resume at a lower dose level. Withhold dabrafenib for Grade 3 haemorrhagic events; if improved resume at a lower dose level (see section 4.2).

### Cardiac effects

#### *Left ventricular ejection fraction (LVEF) reduction/Left Ventricular dysfunction*

MEKINIST has been reported to decrease LVEF (see section 4.8). In clinical trials, the median time to onset of the first occurrence of left ventricular dysfunction, cardiac failure, and LVEF decrease, in patients treated with trametinib as monotherapy or in combination with dabrafenib, was between 2 to 5 months.

Across clinical trials of MEKINIST at the recommended dose (N = 329), 11% of patients developed evidence of cardiomyopathy (decrease in left ventricular ejection fraction, or LVEF, below institutional lower limits of normal with an absolute decrease in LVEF  $\geq$  10% below baseline) and 5% demonstrated a decrease in LVEF below institutional lower limits of normal with an absolute decrease in LVEF of  $\geq$  20% below baseline.

MEKINIST should be used with caution in patients with conditions that could impair left ventricular function. LVEF should be evaluated by echocardiogram or multigated acquisition (MUGA) scan in all

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

patients prior to initiation of treatment with MEKINIST, one month after initiation of therapy, and then at approximately 3 monthly intervals, as clinically appropriate, while on treatment (see section 4.2).

MEKINIST should be interrupted in patients who have an asymptomatic, absolute decrease of  $\geq 10\%$  in LVEF compared to baseline and the ejection fraction is below the institution's lower limit of normal (LLN). If MEKINIST is being used in combination with dabrafenib then therapy with dabrafenib may be continued at the same dose. If the LVEF recovers, treatment with MEKINIST may be restarted, but the dose should be reduced by one dose level with careful monitoring.

With Grade 3 or 4 left ventricular cardiac dysfunction or if LVEF does not recover MEKINIST should be permanently discontinued. If MEKINIST is being used in combination with dabrafenib then therapy with dabrafenib should be withheld and resumed at the same dose upon recovery of cardiac function (see section 4.2).

### *QT Prolongation*

Initially, the QT prolongation potential of trametinib was assessed as part of the first time in human study MEK111054 to determine the relationship between the independently manually-read QTc interval and plasma concentrations of trametinib using a nonlinear mixed effects model. Data were available in 50 subjects with a total of 498 matched QTc values. Based on the concentration-QTc analysis, trametinib showed no apparent potential to alter the QTc interval. At the mean  $C_{max}$  value observed at the recommended dose of 2 mg once daily, the median increase in QTc is 2.2 milliseconds (ms) (90 % CI: 0.2, 4.0).

In BRF113220, QTcF prolongation to  $>500$  ms occurred in 4 % (2/55) of patients treated with MEKINIST in combination with dabrafenib and in 2 % (1/53) of patients treated with dabrafenib as a single agent. The QTcF was increased more than 60 ms from baseline in 13 % (7/55) of patients treated with MEKINIST in combination with dabrafenib and 2 % (1/53) of patients treated with dabrafenib as a single agent.

To confirm the lack of effect on QTc, the QT prolongation potential of trametinib was further assessed in a dedicated, stand-alone Phase I study MEK114655 in 35 subjects (32 subjects completed the study) with solid tumours. Subjects received 3 mg matched placebo on study day 1 followed by a 2 mg once daily dose of trametinib and 2 tablets of 0.5 mg matched placebo on study days 2 to 14. On study day 15, all subjects received a single dose of 3 mg trametinib (supratherapeutic dose). The study showed no potential for trametinib to alter the QTcF interval after repeat dose administration of 2 mg trametinib, including at the supratherapeutic dose of 3 mg on day 15. At a dose 1.5 times the maximum recommended dose, Mekinist does not prolong the QT interval to any clinically relevant extent.

### Visual impairment

A thorough ophthalmological evaluation should be performed at baseline and during treatment with trametinib, if clinically warranted. If a retinal abnormality is noted, treatment with trametinib should be interrupted immediately and referral to a retinal specialist should be considered.

The data from clinical trials demonstrates that when all reported ocular events are pooled, there was a higher reported rate in the subjects treated with combination therapy than monotherapy (20% vs 13%, respectively). The median exposure time for combination therapy was substantially longer than MEKINIST monotherapy (6.41 vs. 3.84 months, respectively).

Disorders associated with visual disturbance, including retinal pigment chorioretinopathy or epithelial detachment (RPED) and retinal vein occlusion (RVO), have been observed with MEKINIST as monotherapy and in combination with dabrafenib. Symptoms such as blurred vision, decreased acuity, and other visual phenomena have been reported in the clinical trials with MEKINIST (see section 4.8). If patients report new visual disturbances such as diminished central vision, blurry vision, or loss of vision at any time while on MEKINIST therapy, a prompt ophthalmological assessment is recommended.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### Retinal Pigment Epithelial Detachment (RPED)

Retinal pigment epithelial detachments (RPED) can occur during treatment with MEKINIST. Across all clinical trials of MEKINIST, the incidence of RPED was 0.8% (14/1749). Retinal detachments were often bilateral and multifocal, occurring in the macular region of the retina. RPED led to reduction in visual acuity that resolved after a median of 11.5 days (range: 3 to 71 days) following the interruption of dosing with MEKINIST, although Ocular Coherence Tomography (OCT) abnormalities persisted beyond a month in at least several cases.

If RPED is diagnosed, follow the dose modification schedule in Table 1 (see section 4.2).

### Retinal Vein Occlusion (RVO)

MEKINIST is not recommended in patients with a history of RVO. Across all clinical trials of MEKINIST, the incidence of RVO was 0.2% (4/1749). An RVO may lead to macular oedema, decreased visual function, neovascularization, and glaucoma.

Urgently (within 24 hours) perform ophthalmological evaluation for patient-reported loss of vision or other visual disturbances. Permanently discontinue MEKINIST in patients who experience RVO.

### Interstitial lung disease (ILD)/Pneumonitis

Any diagnosis of ILD or pneumonitis warrants immediate discontinuation of MEKINIST.

In a Phase 3 trial, 2% (5/211) of patients treated with MEKINIST monotherapy developed ILD or pneumonitis; all five patients required hospitalisation. The median time to first presentation of ILD or pneumonitis was 160 days (range: 60 to 172 days).

Withhold MEKINIST in patients with suspected ILD or pneumonitis, including patients presenting with new or progressive pulmonary symptoms and findings including cough, dyspnoea, hypoxia, pleural effusion, or infiltrates, pending clinical investigations. Permanently discontinue MEKINIST for patients diagnosed with treatment-related ILD or pneumonitis. If MEKINIST is used in combination with dabrafenib, do not modify the dose of dabrafenib.

### Deep vein thrombosis (DVT)/Pulmonary embolism (PE)

DVT and PE can occur on trametinib monotherapy and when trametinib is used in combination with dabrafenib. If patients develop symptoms of pulmonary embolism or deep vein thrombosis they should immediately seek medical care.

### Pyrexia and serious non-infectious febrile events

Pyrexia was reported in the clinical trials with MEKINIST. The incidence and severity of pyrexia are increased when MEKINIST is used in combination with dabrafenib (see section 4.8). In patients with melanoma who received the combination dose of dabrafenib 150 mg twice daily and MEKINIST 2 mg once daily and developed pyrexia, approximately half of the first occurrences of pyrexia happened within the first month of therapy. About one-third of the patients receiving combination therapy who experienced pyrexia had 3 or more events. Pyrexia may be accompanied by severe rigors, dehydration, and hypotension which in some cases can lead to acute renal insufficiency. Monitor serum creatinine and other evidence of renal function during and following severe events of pyrexia. Renal failure was reported in 7% of patients who received the combination dose of dabrafenib 150 mg twice daily and MEKINIST 2 mg once daily, a higher frequency than observed in dabrafenib monotherapy patients (<1%), and was often seen in the context of pyrexia and dehydration.

Monitor serum creatinine and other evidence of renal function during and following severe events of pyrexia.

Serious non-infectious febrile events have been observed. These events responded well to dose interruption and/or dose reduction and supportive care in clinical trials.

For the management of pyrexia please see section 4.2 in full Data Sheet for dabrafenib.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### Serious Skin Toxicity

Serious skin toxicity can occur when MEKINIST is administered as a single agent or when used in combination with dabrafenib. Serious skin toxicity can also occur with dabrafenib as a single agent (refer to Product Information for dabrafenib).

In MEK114267, the overall incidence of any skin toxicity, the most common of which were rash (see section 4.8 – Rash), dermatitis acneiform rash, palmar-plantar erythrodysesthesia syndrome, and erythema, was 87% in patients treated with MEKINIST and 13% in chemotherapy-treated patients. Severe skin toxicity occurred in 12% of patients treated with MEKINIST. Skin toxicity requiring hospitalization occurred in 6% of patients treated with MEKINIST, most commonly for secondary infections of the skin requiring intravenous antibiotics or severe skin toxicity without secondary infection. In comparison, no patients treated with chemotherapy required hospitalization for severe skin toxicity or infections of the skin. The median time to onset of skin toxicity in patients treated with MEKINIST was 15 days (range: 1 to 221 days) and median time to resolution of skin toxicity was 48 days (range: 1 to 282 days). Reductions in the dose of MEKINIST were required in 12% and permanent discontinuation of MEKINIST was required in 1% of patients with skin toxicity.

In BRF113220, the incidence of any skin toxicity was similar for patients receiving MEKINIST in combination with dabrafenib (65% [36/55]) compared with patients receiving dabrafenib as a single agent (68% [36/53]). The median time to onset of skin toxicity in patients treated with MEKINIST in combination with dabrafenib was 37 days (range: 1 to 225 days) and median time to resolution of skin toxicity was 33 days (range: 3 to 421 days). No patient required dose reduction or permanent discontinuation of MEKINIST or dabrafenib for skin toxicity.

Across clinical trials of MEKINIST administered in combination with dabrafenib (n = 202), severe skin toxicity and secondary infection of the skin requiring hospitalization occurred in 2.5% (5/202) of patients treated with MEKINIST in combination with dabrafenib.

Withhold MEKINIST, and dabrafenib if used in combination, for intolerable or severe skin toxicity until further assessment (see section 4.2). MEKINIST and dabrafenib may be resumed at a lower dose level in patients with improvement or recovery from skin toxicity within three weeks.

### Rash

In clinical studies with trametinib, rash has been observed in about 60 % of patients as monotherapy and 30 % in combination with dabrafenib (see section 4.2). The majority of these cases were Grade 1 or 2 and did not require any dose interruptions or dose reductions.

### Severe cutaneous adverse reactions

Cases of severe cutaneous adverse reactions (SCARs), including Stevens-Johnson syndrome, and drug reaction with eosinophilia and systemic symptoms (DRESS), which can be life-threatening or fatal, have been reported during treatment with Mekinist in combination with Tafinlar. Before initiating treatment, patients should be advised of the signs and symptoms and monitored closely for skin reactions. If signs and symptoms suggestive of SCARs appear, Mekinist and Tafinlar should be withdrawn.

### Venous thromboembolism (VTE)

VTE, including deep vein thrombosis (DVT) and pulmonary embolism (PE), can occur with trametinib monotherapy and with trametinib used in combination with dabrafenib. If patients develop symptoms of VTE they should be advised to immediately seek medical care (see section 4.8).

### Hepatic Events

Hepatic adverse events have been reported in clinical trials with MEKINIST as monotherapy and in combination with dabrafenib. It is recommended that patients receiving treatment with MEKINIST monotherapy or in combination with dabrafenib have liver function monitored every four weeks for 6 months after treatment initiation with MEKINIST (see section 4.8).

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### Colitis and gastrointestinal perforation

Colitis and gastrointestinal perforation, including fatal outcome, have been reported in patients taking MEKINIST as monotherapy and in combination with Tafinlar (see section 4.8). Treatment with MEKINIST monotherapy or in combination with Tafinlar should be used with caution in patients with risk factors for gastrointestinal perforation, including a history of diverticulitis, metastases to the gastrointestinal tract and concomitant use of medications with a recognized risk of gastrointestinal perforation.

If patients develop symptoms of colitis and gastrointestinal perforation, they should immediately seek medical care.

### Use in paediatrics (< 18 years of age)

The safety and efficacy of MEKINIST has not been yet established in children and adolescents (< 18 years).

### Use in patients ≥ 65 years of age

No initial dose adjustments are required in patients over 65 years of age (see section 5.2).

More frequent dose adjustments (see Table 7 and Table 8) may be required in patients over 65 years of age (see section 4.8). Across clinical trials of MEKINIST administered in combination with dabrafenib (n = 202), adverse events resulting in dose interruption were reported for 71% of those aged ≥65 years as compared to 60% of those <65 years, while adverse events resulting in dose reduction occurred in 64% of those aged ≥65 years as compared to 44% of those <65 years.

Clinical trials of MEKINIST administered as a single agent or in combination with dabrafenib did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In MEK114267, 49 patients (23%) were 65 years of age and older, and 9 patients (4%) were 75 years of age and older. Across clinical trials of MEKINIST administered in combination with dabrafenib (n = 202), 42 patients (21%) were 65 years of age and older, and 12 patients (6%) were 75 years of age and older.

## **4.5 Interactions with other medicines and other forms of interaction**

### Monotherapy

As trametinib is metabolised predominantly via deacetylation mediated by hydrolytic enzymes (including carboxylesterases), its pharmacokinetics are unlikely to be affected by other agents through metabolic interactions. Trametinib repeat-dose exposure was not affected by co-administration with a cytochrome P450 (CYP) 3A4 inducer.

Based on in vitro and in vivo data, MEKINIST is unlikely to significantly affect the pharmacokinetics of other medicinal products via interactions with CYP enzymes or transporters. Repeat dose administration of Mekinist 2 mg once daily had no clinically relevant effect on the single dose C<sub>max</sub> and AUC of dabrafenib, a CYP2C8/CYP3A4 substrate.

### Combination MEKINIST with dabrafenib

Co-administration of repeat dosing of dabrafenib 150 mg twice daily and MEKINIST 2 mg once daily resulted in a 16 % increase in dabrafenib C<sub>max</sub> and a 23 % increase in dabrafenib AUC. A small decrease in trametinib bioavailability, corresponding to a decrease in AUC of 12 %, was estimated when Tafinlar is administered in combination with Mekinist using a population pharmacokinetic analysis. These changes in dabrafenib or trametinib C<sub>max</sub> and AUC are considered not clinically relevant.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### In vitro evaluation of drug interaction potential

#### Effects of Other Drugs on MEKINIST

In vivo and in vitro data suggest that the PK of MEKINIST are unlikely to be affected by other drugs. Trametinib is deacetylated via carboxylesterases and possibly other hydrolytic enzymes. There is little evidence from clinical studies for drug interactions mediated by carboxylesterases. CYP enzymes play a minor role in the elimination of trametinib and the compound is not a substrate of the following transporters: breast cancer resistance protein (BCRP), organic anion transporting polypeptide (OATP) 1B1, 1B3, 2B1, organic cation transporter (OCT) 1, multidrug resistance-associated protein (MRP) 2, and the multidrug and toxin extrusion protein (MATE) 1. Trametinib is an in vitro substrate of the efflux transporter P-glycoprotein (P-gp), but is unlikely to be significantly affected by inhibition of this transporter given its high passive permeability and high bioavailability.

#### Effects of MEKINIST on Drug Metabolising Enzymes and Transporters

In vitro and in vivo data suggest that trametinib is unlikely to affect the PK of other drugs. Based on in vitro studies, trametinib is not an inhibitor of CYP1A2, CYP2A6, CYP2B6, CYP2D6 and CYP3A4. Trametinib was found to be an in vitro inhibitor of CYP2C8, CYP2C9 and CYP2C19, an inducer of CYP3A4 and an inhibitor of the transporters OAT1, OAT3, OCT2, MATE1, OATP1B1, OATP1B3, P-gp and BCRP. However, based on the low dose and low clinical systemic exposure relative to the in vitro potency of inhibition or induction, trametinib is not considered to be an in vivo inhibitor or inducer of these enzymes or transporters. Repeat dose administration of once-daily 2 mg trametinib had no effect on the single dose C<sub>max</sub> and AUC of dabrafenib, a CYP2C8/CYP3A4 substrate, while a small increase in exposure was noted with repeat dose dabrafenib

## 4.6 Fertility, pregnancy and lactation

### Women of childbearing potential/Contraception

#### *Female patients*

Females of reproductive potential should be advised to use effective contraception (methods that result in less than 1% pregnancy rates) when taking MEKINIST and for at least sixteen weeks after stopping treatment with MEKINIST.

Females of reproductive potential receiving MEKINIST in combination with dabrafenib should be advised that Tafinlar may decrease the efficacy of oral or any other systemic hormonal contraceptives and an effective alternate method of contraception should be used.

#### *Male patients*

Male patients (including those that have had a vasectomy) with sexual partners who are pregnant, possibly pregnant, or who could become pregnant) should use condoms during sexual intercourse while taking MEKINIST monotherapy or in combination with Tafinlar and for at least 16 weeks after stopping treatment with MEKINIST.

### Pregnancy (Category D)

MEKINIST can cause fetal harm when administered to a pregnant woman. There are no adequate and well-controlled studies of MEKINIST in pregnant women. Pregnant women should be advised of the potential risk to the foetus.

MEKINIST should not be administered to pregnant women or nursing mothers (see Lactation). Women of childbearing potential should use effective methods of contraception during therapy and for 4 months following discontinuation of MEKINIST. If MEKINIST is used alone or in combination with dabrafenib, women of child bearing potential should use a non-hormonal method of contraception since dabrafenib can render hormonal contraceptives ineffective. If MEKINIST is used during pregnancy, or if the patient becomes pregnant while taking MEKINIST, the patient should be informed of the potential hazard to the foetus.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

Reproductive studies in animals (rats and rabbits) have demonstrated that MEKINIST induced maternal and developmental toxicity. In rats, decreased foetal weights and incidences of post implantation loss were observed following maternal exposure to trametinib at concentrations 0.3 and 0.8 times the exposure in humans at the highest recommended dose of 2 mg once daily. In rabbits, decreased fetal weight and increased incidence of variations in ossification and post implantation loss were observed following maternal exposure to trametinib at concentrations 0.09 and 0.3 times the exposure in humans at the highest recommended dose of 2 mg once daily.

In embryo-fetal development studies, rats and rabbits received oral doses of trametinib up to 0.125 mg/kg/day and 0.31 mg/kg/day, respectively, during the period of organogenesis. In rats at  $\geq 0.031$  mg/kg/day and 0.125 mg/kg/day, maternal systemic exposures (AUC) were 110 ng\*h/mL and 684 ng\*h/mL, respectively, corresponding to approximately 0.3 and 1.8 times the exposure in humans at the highest recommended dose of 2 mg once daily. At doses  $\geq 0.031$  mg/kg/day developmental toxicity consisted of decreased fetal weights. At a dose of 0.125 mg/kg/day there was maternal toxicity and increases in post implantation loss. In rabbits at  $\geq 0.039$  mg/kg/day and 0.15 mg/kg/day, maternal systemic exposures (AUC) were 31.9 ng\*h/mL and 127 ng\*h/mL, respectively corresponding to approximately 0.09 and 0.3 times the exposures in humans at the highest recommended dose of 2 mg once daily. At doses  $\geq 0.039$  mg/kg/day developmental toxicity consisted in decreased fetal body weight and increased incidence of variations in ossification. At doses 0.15 mg/kg/day there were increases in post-implantation loss, including total loss of pregnancy, compared with control animals.

### Lactation

There are no data on the effect of MEKINIST on the breast-fed child, or the effect of MEKINIST on milk production. Because many drugs are transferred into human milk and because of the potential for adverse reactions in nursing infants from MEKINIST, a nursing woman should be advised of the potential risk to the child. The developmental and health benefits of breast-feeding should be considered along with the mother's clinical need for MEKINIST and any potential adverse effects on the breast-fed child from MEKINIST or from the underlying maternal condition.

### Fertility

#### *MEKINIST monotherapy*

There is no information on the effect of MEKINIST on human fertility. In animals, no fertility studies have been performed, but adverse effects were seen on female reproductive organs. Mekinist may impair fertility in humans.

In adult and juvenile rat repeat dose studies with MEKINIST, alterations in follicular maturation, consisting of increases in ovarian cystic follicles and decrease in corpora lutea were observed in female rats  $\geq 0.016$  mg/kg/day (0.3 times the clinical exposure based on AUC). MEKINIST may impair female fertility in humans. However, in rat and dog toxicity studies up to 13 weeks in duration, there were no treatment-related effects observed on male reproductive tissues.

Additionally, in juvenile rats given MEKINIST, decreased ovarian weights, slight delays in hallmarks of female sexual maturation (vaginal opening and increased incidence of prominent terminal end buds within the mammary gland), and slight hypertrophy of the surface epithelium of the uterus were observed. All of these effects were reversible following an off-treatment period and attributable to pharmacology. However, in rat and dog toxicity studies up to 13 weeks in duration, there were no treatment-related effects observed on male reproductive tissues.

#### *Males taking MEKINIST in combination with dabrafenib*

Male fertility studies in animals with the trametinib/dabrafenib combination have not been conducted. Effects on spermatogenesis have been observed in animals given dabrafenib. Male patients should be informed of the potential risk for impaired spermatogenesis, which may be irreversible. See Data Sheet information for dabrafenib for more detail.

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### 4.7 Effects on ability to drive and use machines

There have been no studies to investigate the effect of MEKINIST on driving performance or the ability to operate machinery. A detrimental effect on such activities would not be anticipated from the pharmacology of MEKINIST. The clinical status of the patient and the adverse event profile of MEKINIST should be borne in mind when considering the patient's ability to perform tasks that require judgment, motor and cognitive skills.

### 4.8 Undesirable effects

#### Clinical trial data

#### **Unresectable or metastatic melanoma**

#### Monotherapy

The safety of MEKINIST monotherapy has been evaluated in an integrated population of 329 patients with metastatic melanoma treated with MEKINIST 2 mg orally once daily in studies MEK114267, MEK113583, and MEK111054. Of these patients, 211 patients were treated with MEKINIST for BRAF mutant melanoma in the randomized open label study MEK114267 (see section 5.1). The most common adverse reactions ( $\geq 20\%$ ) for MEKINIST include rash, diarrhoea, fatigue, oedema peripheral, nausea, and dermatitis acneiform. In clinical trials with MEKINIST, adverse reactions of diarrhoea and rash were managed with appropriate supportive care (see section 4.2).

Adverse reactions are listed in Table 7 and Table 8 by MedDRA body system organ class. Table 8 lists the very common adverse events ( $\geq 10\%$ ) reported in patients receiving MEKINIST.

The following convention has been utilised for the classification of frequency:

Very common	$\geq 1$ in 10
Common	$\geq 1$ in 100 and $< 1$ in 10
Uncommon	$\geq 1$ in 1,000 and $< 1$ in 100

Categories have been assigned based on absolute frequencies in the clinical trial data.

**Table 7 Unresectable or metastatic melanoma - adverse reactions with MEKINIST monotherapy (N = 329)**

<b>Infections and Infestations</b>

### Combination of MEKINIST with dabrafenib

The safety of trametinib and dabrafenib combination therapy has been evaluated in 2 randomized Phase III studies of patients with BRAF mutant unresectable or metastatic melanoma treated with trametinib 2 mg orally once daily and dabrafenib 150 mg orally twice daily (see section 5.1). The most common adverse reactions ( $\geq 20\%$ ) for trametinib and dabrafenib combination therapy include pyrexia, fatigue, nausea, headache, chills, diarrhoea, rash, arthralgia, hypertension, vomiting, peripheral oedema, and cough.

Table 9 lists adverse reactions when MEKINIST was used in combination with dabrafenib from the randomized double-blind Phase III study MEK115306 (N=209), and integrated safety data from MEK115306 (N=209) and from the randomized open-label Phase III study MEK 116513 (N=350).

The following convention has been utilised for the classification of frequency:

Very common:  $\geq 1/10$

Common:  $\geq 1/100$  and  $< 1/10$

*Note: As patient numbers are small the frequencies of uncommon or rare events could not be determined.*

**Table 9 Unresectable or metastatic melanoma - Adverse reactions for trametinib in combination with dabrafenib from the randomized double-blind phase III combination study MEK115306, and integrated safety data from two randomized phase III combination studies, MEK115306 and MEK116513**

Hyperbilirubinemia	0	0	0	7	4	0	15	0	0

<sup>a</sup> No Grade 4 events were reported in dabrafenib arm.

ALP = alkaline phosphatase; AST= aspartate transaminase; ALT = alanine transaminase

### *Metastatic melanoma patients with brain metastases*

The safety profile observed in study BRF117277/DRB436B2204 (COMBI-MB) in metastatic melanoma patients with brain metastases is consistent with the safety profile of Mekinist in combination with Tafinlar in unresectable or metastatic melanoma (see also section 5.1, Pharmacodynamic Properties - Clinical Trials).

### **Adjuvant treatment of melanoma**

#### **MEKINIST in combination with dabrafenib**

The safety of MEKINIST in combination with Tafinlar was evaluated in a Phase III, randomized, double-blind study of MEKINIST in combination with Tafinlar versus two placebos in the adjuvant treatment of Stage III BRAF V600 mutation-positive melanoma after surgical resection (see section 5.1).

In the MEKINIST 2 mg once daily and Tafinlar 150 mg twice daily arm, the most common adverse reactions ( $\geq 20\%$ ) were pyrexia, fatigue, nausea, headache, rash, chills, diarrhoea, vomiting, and arthralgia.

Table 11 lists the adverse drug reactions in study BRF115532 (COMBI-AD) occurring at an incidence  $\geq 10\%$  for all grade adverse reactions or at an incidence  $\geq 2\%$  for Grade 3 and Grade 4 adverse drugs reactions or adverse events that are medically significant in the MEKINIST in combination with TAFINLAR arm.

Adverse drug reactions are listed by MedDRA system organ class. Within each system organ class, the adverse drug reactions are ranked by frequency, with the most frequent adverse drug reactions first. In addition, the corresponding frequency category for each adverse drug reaction is based on the following convention (CIOMS III):

Very common	$\geq 1$ in 10
Common	$\geq 1$ in 100 and $< 1$ in 10
Uncommon	$\geq 1$ in 1,000 and $< 1$ in 100
Rare	$\geq 1/10,000$ to $< 1/1,000$
Very rare	$< 1/10,000$

### **Locally advanced or metastatic anaplastic thyroid cancer**

#### **MEKINIST in combination with TAFINLAR**

The efficacy and safety of MEKINIST in combination with Tafinlar was studied in a Phase II, nine-cohort, multicentre, non-randomized, open-label study in patients with rare cancers with the BRAF V600E mutation, including locally advanced or metastatic ATC (see section 5.1 Clinical Trials).

The 'All Treated Patients (ATS)' population was the primary safety population for the study and includes all patients who received at least one dose of MEKINIST or TAFINLAR from all the histologic

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

cohorts. The safety profiles in the ATS population and in the ATC cohort are consistent.

At the time of safety analysis, the most common adverse events ( $\geq 20\%$ ) reported for MEKINIST in combination with Tafinlar in the ATS population were fatigue, pyrexia, rash, nausea, chills, vomiting, cough, and headache.

Table 12 lists the adverse drug reactions for MEKINIST in combination with Tafinlar occurring at an incidence  $\geq 10\%$  for all grade adverse drug reactions or at an incidence  $\geq 2\%$  for Grade 3 and Grade 4 adverse drug reactions or events which are medically significant in Study BRF117019.

Adverse drug reactions are listed by MedDRA system organ class. Within each system organ class, the adverse drug reactions are ranked by frequency, with the most frequent adverse drug reactions first. In addition, the corresponding frequency category for each adverse drug reaction is based on the following convention (CIOMS III):

Very common	$\geq 1$ in 10
Common	$\geq 1$ in 100 and $< 1$ in 10
Uncommon	$\geq 1$ in 1,000 and $< 1$ in 100
Rare	$\geq 1/10,000$ to $< 1/1,000$
Very rare	$< 1/10,000$ .

### **Advanced non-small cell lung cancer**

#### **MEKINIST in combination with Tafinlar**

The safety of MEKINIST in combination with Tafinlar was evaluated in a Phase II, multicentre, multi-cohort, non-randomized, open-label study of patients with BRAF V600E mutation positive metastatic NSCLC (see section 5.1).

In the MEKINIST 2 mg orally once daily and Tafinlar 150 mg orally twice daily arms (Cohorts B and C) the most common adverse events ( $\geq 20\%$ ) reported for MEKINIST and Tafinlar combination therapy were pyrexia, nausea, vomiting, peripheral oedema, diarrhoea, decreased appetite, asthenia, dry skin, chills, cough, fatigue, rash, and dyspnoea.

Table 13 lists the adverse drug reactions for MEKINIST in combination with Tafinlar occurring at an incidence  $\geq 10\%$  for all adverse drug reactions or at an incidence  $\geq 2\%$  for Grade 3 and Grade 4 adverse drug reactions or events which are medically significant in Cohorts B and C of study BRF113928.

Adverse drug reactions are listed by MedDRA system organ class. Within each system organ class, the adverse drug reactions are ranked by frequency, with the most frequent adverse drug reactions

NR: Not Reported

### Post-marketing experience and pooled clinical trials

The following adverse reactions have been derived from post-marketing experience including spontaneous case reports with MEKINIST in combination with Tafinlar. Because post-marketing adverse reactions are reported from a population of uncertain size, it is not always possible to reliably estimate their frequency. Where applicable, these frequencies have been calculated from the pooled clinical trials across indications. Adverse reactions are listed according to system organ classes in MedDRA.

**Table 14 Adverse reactions from post-marketing experience and pooled clinical trials across indications**

Adverse reaction	Frequency
<i>Vascular disorders</i>	
Venous thrombo-embolism (VTE) <sup>1</sup>	Common
<i>Immune system disorders</i>	
Sarcoidosis	Uncommon

<sup>1</sup> VTE includes pulmonary embolism, deep vein thrombosis, embolism and venous thrombosis.

### Special Populations

#### *Patients ≥ 65 years of age*

In the phase III study with MEKINIST in patients with unresectable or metastatic melanoma (n = 211), 49 patients (23%) were ≥ 65 years of age, and 9 patients (4%) were ≥ 75 years of age. The proportion of subjects experiencing adverse events (AE) and serious adverse events (SAE) was similar in the subjects aged < 65 years and those aged ≥ 65 years. Patients ≥ 65 years were more likely to experience AEs leading to permanent discontinuation of study drug, dose reduction and dose interruption than those < 65 years.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

In the phase I/II study of MEKINIST in combination with dabrafenib in patients with unresectable or metastatic melanoma (n = 202), 42 patients (21%) were ≥ 65 years of age, and 12 patients (6%) were ≥ 75 years of age. The proportion of subjects experiencing AEs was similar in the subjects aged < 65 years and those aged ≥ 65 years. Patients ≥ 65 years were more likely to experience SAEs, fatal SAEs and AEs leading to permanent discontinuation of study drug, dose reduction and dose interruption than those < 65 years.

### Reporting of suspected adverse reactions

The reporting suspected adverse reactions after the authorisation of the medicine is important. It allows for continued monitoring of the benefit/risk balance of the medicine. Healthcare professionals are asked to report any suspected adverse reactions to Medsafe via the following web site: <https://nzphvc.otago.ac.nz/reporting/>.

## 4.9 Overdose

There were no cases of MEKINIST dose above 4 mg once daily reported from the clinical trials. Doses of up to 4 mg orally once daily, and loading doses of 10 mg orally once daily administered on two consecutive days have been evaluated in clinical trials.

### Treatment

There is no specific treatment for an overdose of MEKINIST. If overdose occurs, the patient should be treated supportively with appropriate monitoring as necessary. Haemodialysis is not expected to enhance the elimination as MEKINIST is highly bound to plasma proteins. Further management should be as clinically indicated.

For advice on the management of overdose, please contact the National Poisons Centre on 0800 764 766.

## 5. PHARMACOLOGICAL PROPERTIES

### 5.1 Pharmacodynamic properties

Pharmacotherapeutic group: antineoplastic agents, protein kinase inhibitors  
Anatomical Therapeutic Chemical (ATC) code: L01XE25

### Mechanism of Action

#### *MEKINIST monotherapy – Melanoma, ATC, and NSCLC*

Trametinib (MEKINIST) is a reversible allosteric inhibitor of mitogen-activated extracellular signal regulated kinase 1 (MEK1) and 2 (MEK2) activation and kinase activity. MEK proteins are critical components of the extracellular signal-regulated kinase (ERK) pathway. In melanoma and other cancers, this pathway is often activated by mutated forms of BRAF which activates MEK and stimulates tumour cell growth. Trametinib inhibits activation of MEK by BRAF and inhibits MEK kinase activity. Trametinib inhibits growth of BRAF V600 mutant melanoma, ATC, and NSCLC cell lines *in vitro* and demonstrates anti-tumour effects in BRAF V600 mutant melanoma xenograft models.

#### *MEKINIST in combination with dabrafenib – Melanoma, ATC, and NSCLC*

Dabrafenib is an ATP-competitive inhibitor of BRAF V600 mutant kinases and wild type BRAF and CRAF kinases. Mutations in BRAF lead to constitutive activation of the RAS/RAF/MEK/ERK pathway and stimulation of tumour cell growth. Dabrafenib and trametinib inhibit two critical kinases in this pathway, BRAF and MEK, and the combination provides concomitant inhibition of the pathway. Combination of dabrafenib with trametinib is synergistic in BRAF V600 mutation positive melanoma,

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

ATC, and NSCLC cell lines *in vitro* and delays the emergence of resistance *in vivo* in BRAF V600 mutation positive melanoma xenografts.

### Pharmacodynamic Effects

Trametinib suppressed levels of phosphorylated ERK, in BRAF mutant melanoma tumour cell lines and melanoma xenograft models.

In patients with BRAF mutant melanoma, administration of trametinib resulted in dose-dependent changes in tumour biomarkers including inhibition of phosphorylated ERK, inhibition of Ki67 (a marker of cell proliferation), and increases in p27 (a marker of apoptosis). The mean trametinib concentrations observed following repeat dose administration of 2 mg once daily exceeds the preclinical target concentration over the 24-hour dosing interval, thereby providing sustained inhibition of the MEK pathway.

## CLINICAL TRIALS

### Determination of BRAF mutation status

In the Phase II and III clinical trials, screening for eligibility required central testing for BRAF V600 mutation using a BRAF mutation assay conducted on the most recent tumour sample available. Primary tumour or tumour from a metastatic site was tested with an investigational use only assay (IUO) developed by Response Genetics Inc. (RGI). The RGI IUO is an allele-specific polymerase chain reaction (PCR) assay performed on DNA extracted from formalin-fixed paraffin-embedded (FFPE) tumour tissue. The assay was specifically designed to differentiate between the V600E and V600K mutations.

Only subjects with BRAF V600E or V600K mutation positive tumours were eligible for study participation.

### Unresectable or metastatic melanoma

#### MEKINIST monotherapy

#### *Open Label Studies*

#### **MEK114267**

The efficacy and safety of MEKINIST in patients with BRAF mutant unresectable or metastatic melanoma (V600E and V600K) were evaluated in this randomised open label study. Measurement of patients BRAF V600 mutation status was required. Screening included central testing of BRAF mutation (V600E and V600K) using a BRAF mutation assay conducted on the most recent tumour sample available.

Patients (N = 322) who were treatment naïve or may have received one prior chemotherapy treatment in the metastatic setting [Intent to Treat (ITT) population] were randomised 2:1 to receive MEKINIST 2 mg once daily or chemotherapy (dacarbazine 1000 mg/m<sup>2</sup> every 3 weeks or paclitaxel 175 mg/m<sup>2</sup> every 3 weeks). Treatment for all patients continued until disease progression, death or withdrawal.

The primary endpoint of the study was to evaluate the efficacy of MEKINIST compared to chemotherapy with respect to progression-free survival (PFS) in patients with advanced (unresectable or metastatic) BRAF V600E mutation-positive melanoma without a prior history of brain metastases (N = 273) which is considered the primary efficacy population (see Figure 1). The secondary endpoints were progression-free survival in the ITT population and overall survival (OS), overall response rate (ORR), and duration of response in the primary efficacy population and ITT population. Patients in the chemotherapy arm were allowed to cross-over to the MEKINIST arm after independent confirmation of progression. A total of 51 (47%) of patients with confirmed disease progression in the chemotherapy arm, crossed over to receive MEKINIST.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

Baseline characteristics were balanced between treatment groups in the primary efficacy population and the ITT population. In the ITT population, the majority of patients were male (54%) and all were Caucasian (100%). The median age was 54 years (22% were ≥65 years), most patients (64%) had ECOG performance status of 0, and 11 patients (3%) had history of brain metastases. Most patients (87%) in the ITT population had BRAF V600E mutation and 12% of patients had BRAF V600K. Most patients (66%) received no prior chemotherapy for advanced or metastatic disease.

The efficacy results in the primary efficacy population were consistent with those in the ITT population; therefore, only the efficacy data for the ITT population are presented in Table 15. At the time of the data cut off, 51 patients (47%) on the chemotherapy arm had crossed over to the MEKINIST arm after disease progression. These patients are included in the OS analysis.

**Table 15 MEK114267 - Investigator-Assessed Efficacy Results (ITT Population)**

Endpoint	MEKINIST (N = 214)	Chemotherapy <sup>a</sup> (N = 108)
<b>Progression-Free Survival (PFS)</b>		
Median PFS (months) (95% CI)	4.8 (4.3, 4.9)	1.5 (1.4, 2.7)
Hazard Ratio (95% CI) P value		0.45 (0.33, 0.63) <0.0001
<b>Overall Survival</b>		
Died, n (%)	35 (16)	29 (27)
Hazard Ratio (95% CI) P value		0.54 (0.32, 0.92) 0.0136
Survival at 6 months (%) (95% CI)	81 (73, 86)	67 (55, 77)
<b>Overall Response Rate (%)</b>	22	8

ITT = Intent to treat; PFS = Progression-free survival; CI = Confidence interval.

<sup>a</sup> Chemotherapy included patients on dacarbazine (DTIC) 1000 mg/m<sup>2</sup> every 3 weeks or paclitaxel 175 mg/m<sup>2</sup> every 3 weeks.

*trametinib dimethyl sulfoxide*

**Figure 1 MEK114267 Investigator-Assessed Progression-Free Survival (ITT population)**

The PFS result was consistent in the subgroup of patients with V600K mutation positive melanoma (HR = 0.50; [95% CI: 0.18, 1.35], p=0.0788).

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### ***MEK113583 – Phase II BRAF inhibitor pre-treatment study***

In single arm, multicentre, Phase II Study MEK113583, evaluated the objective response rate, safety and PK following oral daily dosing of MEKINIST at 2 mg QD in patients with BRAF V600E, V600K, or V600D mutation-positive metastatic melanoma, previously treated with or without a BRAF inhibitor (BRAFi). Patients were enrolled into two separate cohorts, defined by therapy received prior to MEKINIST: Cohort A- patients (n=40) had received prior treatment with a BRAF inhibitor (BRAFi). Cohort B- patients (n=57) were BRAFi-naïve and had received at least 1 prior chemotherapy or immunotherapy.

MEKINIST did not demonstrate clinical activity in Cohort A (patients who progressed on a prior BRAF inhibitor therapy in one of the cohorts, see section 4.1).

### **MEKINIST in combination with dabrafenib**

The efficacy and safety of the recommended dose of MEKINIST (2 mg once daily) in combination with TAFINLAR (dabrafenib 150 mg twice daily) for the treatment of adult patients with unresectable or metastatic melanoma with a BRAF V600 mutation was studied in two pivotal Phase III studies, MEK116513 and MEK115306.

### ***MEK116513 (COMBI-v)***

Study MEK116513 was a 2-arm, randomized, open-label, Phase III study comparing trametinib and dabrafenib combination therapy with vemurafenib monotherapy in BRAF V600 mutation-positive unresectable or metastatic melanoma. The primary endpoint of the study was overall survival (Figure 2), and the key secondary endpoint was PFS. Other secondary objectives included ORR, DoR, and safety. Patients were stratified by lactate dehydrogenase (LDH) level (> the upper limit of normal (ULN) versus ≤ ULN) and BRAF mutation (V600E versus V600K).

A total of 704 patients were randomized 1:1 to either the combination therapy arm (trametinib 2 mg once daily and dabrafenib 150 mg twice daily) or the vemurafenib monotherapy arm (960 mg twice daily). Most patients were white (>96%) and male (55%), with a median age of 55 years (24% were ≥ 65 years). The majority of subjects had Stage IV M1c disease (61%). Most subjects had LDH ≤ULN (67%), ECOG performance status of 0 (70%), and visceral disease (78%) at baseline. Overall, 54% of subjects had < 3 disease sites at Baseline. The majority of patients had a BRAF V600E mutation (89%).

An OS analysis at 5 years demonstrated continued benefit for the combination of dabrafenib and trametinib compared with vemurafenib monotherapy; the median OS for the combination arm was approximately 8 months longer than the median OS for vemurafenib monotherapy (26.0 months versus 17.8 months) with 5 year survival rates of 36% for the combination versus 23% for vemurafenib monotherapy (Table 16, Figure 2). The Kaplan-Meier OS curve appears to stabilize from 3 years to 5 years (see Figure 2). The 5-year overall survival rate was 46% (95% CI: 38.8, 52.0) in the combination arm versus 28% (95% CI: 22.5, 34.6) in the vemurafenib monotherapy arm for patients who had a normal lactate dehydrogenase level at baseline, and 16% (95% CI: 9.3, 23.3) in the combination arm versus 10% (95% CI: 5.1, 17.4) in the vemurafenib monotherapy arm for patients with an elevated lactate dehydrogenase level at baseline.

### *Randomised double-blind study*

#### **Trametinib with dabrafenib combination therapy study - MEK115306 (COMBI-d)**

MEK115306 (COMBI-d) was a Phase III, randomized, double-blind study comparing the combination of trametinib and dabrafenib to dabrafenib and placebo as first-line therapy for subjects with unresectable (Stage IIIC) or metastatic (Stage IV) BRAF V600E/K mutation-positive cutaneous melanoma. The primary endpoint of the study was investigator assessed progression-free survival (PFS) with a key secondary endpoint of Overall Survival (OS) (Figure 3). Patients were stratified by lactate dehydrogenase (LDH) level (> the upper limit of normal (ULN) versus ≤ ULN) and BRAF mutation (V600E versus V600K).

A total of 423 subjects were randomized 1:1 to either the combination therapy arm (trametinib 2 mg once daily and dabrafenib 150 mg twice daily) (N = 211) or dabrafenib monotherapy arm (150 mg twice daily) (N = 212). Baseline characteristics were balanced between treatment groups. Males constituted 53 % of patients and the median age was 56 years; Majority of patients had an ECOG performance score of 0 (72 %) and had Stage IVM1c disease (66 %). Most patients had the BRAF V600E mutation (85 %); the remaining 15 % of patients had the BRAF V600K mutation. Patients with brain metastases were not included in the trial.

Median OS and estimated 1-year, 2-year, 3-year, 4 year and 5-year survival rates are presented in Table 18. An OS analysis at 5 years demonstrated continued benefit for the combination of dabrafenib and trametinib compared with dabrafenib monotherapy; the median OS for the combination arm was approximately 7 months longer than the median OS for dabrafenib monotherapy (25.8 months versus 18.7 months) with 5 year survival rates of 32% for the combination versus 27% for dabrafenib monotherapy (Table 18, Figure 3). The Kaplan-Meier OS curve appears to stabilize from 3 to 5 years (see Figure 3).

The 5-year overall survival rate was 40% (95% CI: 31.2, 48.4) in the combination arm versus 33% (95% CI: 25.0, 41.0) in the dabrafenib monotherapy arm for patients who had a normal lactate dehydrogenase level at baseline, and 16% (95% CI: 8.4, 26.0) in the combination arm versus 14%

### BRF117277 / DRB436B2204 (COMBI-MB) – Metastatic melanoma patients with brain metastases

The efficacy and safety of Mekinist in combination with Tafinlar in patients with BRAF mutant-positive melanoma that has metastasized to the brain was studied in a non-randomized open-label, multi-center Phase II study (COMBI-MB study).

A total of 125 patients were enrolled into four cohorts:

- Cohort A: patients with BRAFV600E mutant melanoma with asymptomatic brain metastases without prior local brain-directed therapy and ECOG performance status of 0 or 1.
- Cohort B: patients with BRAFV600E mutant melanoma with asymptomatic brain metastases with prior local brain-directed therapy and ECOG performance status of 0 or 1.
- Cohort C: patients with BRAFV600D/K/R mutant melanoma with asymptomatic brain metastases, with or without prior local brain-directed therapy and ECOG performance status of 0 or 1.
- Cohort D: patients with BRAFV600D/E/K/R mutant melanoma with symptomatic brain metastases, with or without prior local brain-directed therapy and ECOG performance status of 0 or 1 or 2.

The primary endpoint of the study was intracranial response in Cohort A, defined as the percentage of patients with a confirmed intracranial response assessed by the investigator using modified Response Evaluation Criteria in Solid Tumours (RECIST) version 1.1. Efficacy results are summarised in Table 20. Secondary endpoints were duration of intracranial response, ORR, PFS and OS. Efficacy results are summarized in Table 20.

### Adjuvant treatment of melanoma

#### MEKINIST in combination with dabrafenib

##### *Randomised double-blind study*

#### **Study BRF115532 / DRB436F2301 (COMBI-AD)**

The efficacy and safety of MEKINIST in combination with Tafinlar was studied in a Phase III, multicentre, randomized, double blind, placebo-controlled study in patients with Stage III melanoma with a BRAF V600 mutation, following complete resection.

Patients were randomized 1:1 to receive either dabrafenib and trametinib combination therapy (MEKINIST 2 mg once daily and Tafinlar 150 mg twice daily) or two placebos for a period of 12 months. Enrolment required complete resection of melanoma with complete lymphadenectomy within 12 weeks prior to randomization. Any prior systemic anticancer treatment, including radiotherapy, was not allowed. Patients with a history of prior malignancy, if disease free for at least 5 years, were eligible. Patients presenting with malignancies with confirmed activating RAS mutations were not eligible. Patients were stratified by BRAF mutation status (V600E or V600K) and stage of disease prior to surgery (by Stage III sub-stage, indicating different levels of lymph node involvement and primary tumour size and ulceration). The primary endpoint was investigator-assessed relapse-free survival (RFS), defined as the time from randomization to disease recurrence or death from any cause. Radiological tumour assessment was conducted every 3 months for the first two years and every 6 months thereafter, until first relapse was observed. Secondary endpoints include overall survival (OS; key secondary endpoint) and distant metastasis-free survival (DMFS).

A total of 870 patients were randomized to the combination therapy (n=438) and placebo (n=432) arms. Most patients were Caucasian (99%) and male (55%), with a median age of 51 years (18% were ≥65 years). The study included patients with all sub-stages of Stage III disease prior to resection; 18% of these patients had lymph node involvement only identifiable by microscope and no primary tumour ulceration. The majority of patients had a BRAF V600E mutation (91%). The median duration of follow-up (time from randomization to last contact or death) was 2.83 years in the dabrafenib and trametinib combination arm and 2.75 years in the placebo arm.

Results for the primary analysis of RFS are presented in Figure 4 and in Table 21. The study showed a statistically significant difference for the primary outcome of RFS between treatment arms, with an estimated 53 % risk reduction in the dabrafenib and trametinib combination arm as compared to the placebo arm (HR=0.47; 95 % CI: 0.39, 0.58; p=1.53×10<sup>-14</sup>). Results were consistent across subgroups, including stratification factors for disease stage and BRAF V600 mutation type. Median RFS was 16.6 months for the placebo arm, and has not yet been reached for the combination arm.

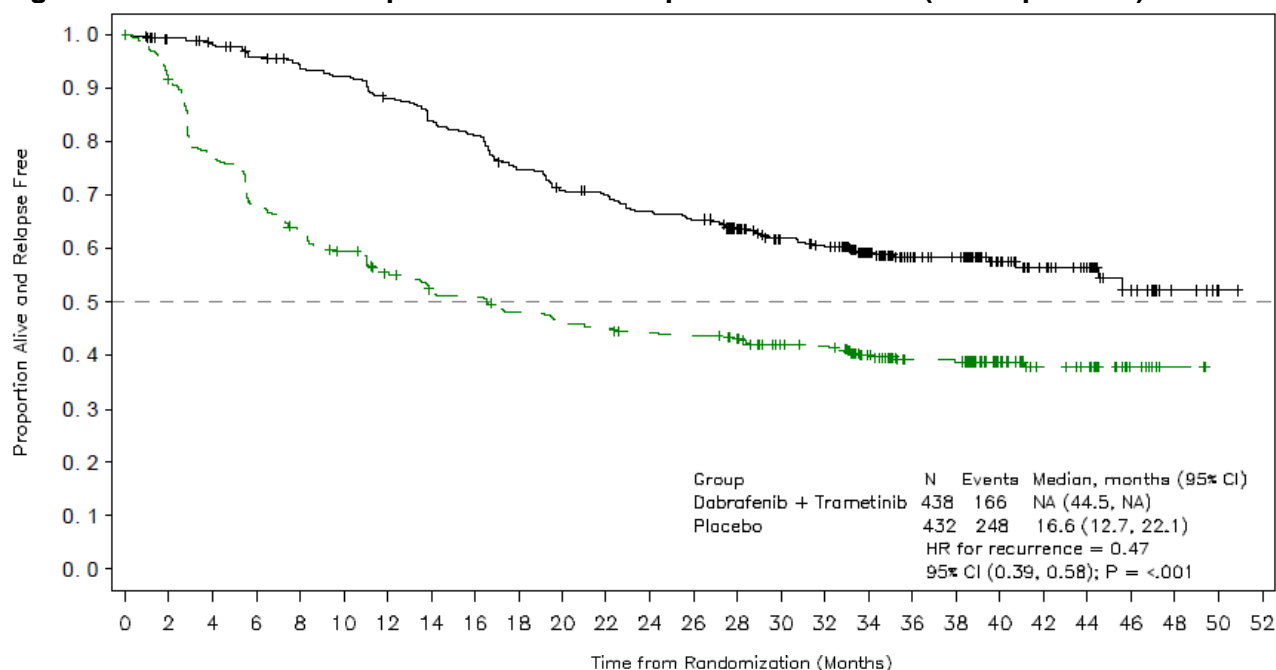

Based on 153 events (60 (14%) in the combination arm and 93 (22%) in the placebo arm) corresponding to a 26 % information fraction of the total target of 597 OS events, the estimated hazard ratio for OS was 0.57 (95 % CI: 0.42, 0.79; p=0.0006). These results did not meet the pre-specified boundary to claim statistical significance at this first OS interim analysis (HR=0.50; p=0.000019). Survival estimates at 1 and 2 years from randomization were 97 % and 91 % in the combination arm and 94 % and 83 % in the placebo arm, respectively. The Kaplan-Meier curve for this OS interim analysis is shown in Figure 5.

### Locally advanced or metastatic anaplastic thyroid cancer

#### MEKINIST in combination with dabrafenib

##### *Non-randomised open label study*

##### **Study BRF117019 (CDRB436X2201)**

The efficacy and safety of MEKINIST in combination with dabrafenib was studied in a Phase II, nine-cohort, multicentre, non-randomized, open-label study in patients with rare cancers with the BRAF V600E mutation, including locally advanced or metastatic anaplastic thyroid cancer (ATC).

The study had pre-specified interim analyses that were performed approximately every 12 weeks. The primary endpoint was the investigator-assessed ORR using the 'Response Evaluation Criteria In Solid Tumours' (RECIST 1.1 assessed by the investigator). Secondary endpoints included DoR, PFS, OS, and safety. ORR, DoR, and PFS were also assessed by an Independent Review Committee (IRC).

In the ATC cohort, patients received MEKINIST 2 mg once daily and dabrafenib 150 mg twice daily. At the time of efficacy analysis, the ATC cohort had 26 patients enrolled, of which 23 patients were evaluable for response. There were 20 ATC patients who had a minimum of 6 months of follow-up after the first scheduled post-baseline assessment or discontinued study treatment prior to that.

Among the 26 patients enrolled, 13 (50%) were Caucasian and 12 (46%) were Asian. The female to male ratio was 1:1. The median age was 70 years. All patients (n=26, 100%) had an ECOG performance status of 0 or 1. Fourteen patients (54%) had a prior history of differentiated thyroid cancer. Prior anti-cancer treatments included surgery (n=24, 92%), external beam radiotherapy

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

n=21, 81%), and systemic therapy (n=14, 54%) for ATC. Central laboratory testing confirmed the BRAF V600E mutation in 23 patients (88%).

For the primary endpoint, the investigator-assessed ORR was 70% (95% CI: 47.1, 86.8) in the ATC cohort. The ORR results assessed by IRC and investigator-assessment were consistent (Table 22).

Responses were durable with a median DoR in the ATC cohort of 12.1 months (95% CI: 3.3, NE) by investigator assessment, and a median PFS of 13.8 months (95% CI: 4.7, NE).

For ATC patients, the median OS was not yet reached at the time of data cut-off. Kaplan-Meier estimate of overall survival at 12 months for ATC patients was 63.8% (95% CI: 36.3, 82.0).

### **Advanced NSCLC**

#### MEKINIST in combination with dabrafenib

*Non-randomised open label studies*

#### **BRF113928 (Study E2201)**

The efficacy and safety of MEKINIST in combination with dabrafenib was studied in a Phase II, three-cohort, multicentre, non-randomized, open-label study enrolling patients with Stage IV BRAF V600E mutant NSCLC.

The primary endpoint was the investigator-assessed ORR using the 'Response Evaluation Criteria In Solid Tumours' (RECIST 1.1 assessed by the investigator). Secondary endpoints included DoR, PFS, OS, safety and population pharmacokinetics. ORR, DoR and PFS were also assessed by an Independent Review Committee (IRC) as a sensitivity analysis.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

Cohorts were enrolled sequentially:

- Cohort A: Monotherapy (dabrafenib 150 mg twice daily): 84 patients enrolled. 78 patients had previous systemic treatment for their metastatic disease (see Product information for dabrafenib on results from Cohort A).
- Cohort B (n=57): Combination therapy (MEKINIST 2 mg once daily and dabrafenib 150 mg twice daily): 59 patients enrolled. 57 patients had previously received one to three lines of systemic treatment for their metastatic disease. Two patients did not have any previous systemic treatment and were included in the analysis for patients enrolled in Cohort C.
- Cohort C (n=36): Combination therapy (MEKINIST 2 mg once daily and dabrafenib 150 mg twice daily): 34 patients enrolled (note: the two patients from Cohort B that did not have any previous systemic treatment were included in the analysis for patients enrolled in Cohort C for a total of 36 patients). All patients received study medication as first-line treatment for metastatic disease.

Among the total of 93 patients who were enrolled in the combination therapy in Cohorts B and C most patients were Caucasians (n = 79, 85 %). There was a similar female to male ratio (54 % vs 46 %). The median age was 64 years in patients who had at least one prior therapy and 68 years in patients who were treatment naïve for their advanced disease. Most patients (n=87, 94 %) enrolled in the combination therapy treated Cohorts had an ECOG performance status of 0 or 1. Twenty-six (26) patients (28 %) had never smoked. Ninety-one (91) patients (97.8 %) had a non-squamous histology. In the pre-treated population, 38 patients (67 %) had one line of systemic anti-cancer therapy for metastatic disease.

For the primary endpoint, the investigator-assessed ORR was 61.1% (95 % CI, 43.5, 76.9) in the first-line population and 66.7 % (95 % CI, 52.9 %, 78.6 %) in the previously treated population. These results met the statistical significance to reject the null hypothesis that the ORR of MEKINIST in combination with dabrafenib for both NSCLC populations was less than or equal to 30%. The ORR results assessed by IRC were consistent to the investigator assessment.

The response was durable with median DoR in the previously treated population reaching 9.8 months (95 % CI, 6.9, 16.0) by investigator assessment. For the first-line population, the median DoR and PFS could not yet be estimated (Table 23) and 68 % of patients with confirmed response were still ongoing in follow-up for duration of response.

## 5.2 Pharmacokinetic Properties

### Absorption

Trametinib is absorbed orally with median time to achieve peak concentrations of 1.5 hours post-dose. The mean absolute bioavailability of a single 2 mg tablet dose is 72% relative to an intravenous (IV) microdose. The increase in exposure ( $C_{max}$  and AUC) was dose-proportional following repeat dosing. Following administration of 2 mg daily, geometric mean  $C_{max}$ ,  $AUC_{(0-t)}$  and predose concentration were 22.2 ng/mL, 370 ng\*hr/mL and 12.1 ng/mL, respectively with a low peak: trough ratio (1.8). Inter-subject variability was low (<28%).

### *Effect of food on trametinib*

Administration of a single dose of trametinib with a high-fat, high-calorie meal resulted in a 70% and 10% decrease in  $C_{max}$  and AUC, respectively compared to fasted conditions (see section 4.2).

### Distribution

Binding of trametinib to human plasma proteins is 97.4%. Trametinib has a volume of distribution of 1,060 L determined following administration of a 5 microgram IV microdose.

### Biotransformation/ metabolism

*In vitro* and *in vivo* studies demonstrated that trametinib is metabolised predominantly via deacetylation alone or in combination with mono-oxygenation. The deacetylated metabolite was further metabolized by glucuronidation. The deacetylation is mediated by the carboxyl-esterases 1b, 1c and 2 and may also be mediated by other hydrolytic enzymes carboxyl-esterases.

### Elimination

Trametinib accumulates with repeat daily dosing with a mean accumulation ratio of 6.0 following a 2 mg once daily dose. Mean terminal half-life is 5.3 days (range 3.4-9.0) after single dose administration. Steady-state is generally achieved by Day 15. Trametinib plasma IV clearance is 3.21 L/hr.

Total dose recovery is low after a 10-day collection period (< 50 %) following administration of a single oral dose of radiolabelled trametinib as a solution, due to the long half-life. Drug-related material was excreted predominantly in the faeces ( $\geq 81\%$  of recovered radioactivity) and to a small extent in urine ( $\leq 19\%$ ). Less than 0.1% of the excreted dose was recovered as parent in urine.

### Special Patient Populations

#### *Hepatic Impairment*

The pharmacokinetics of trametinib were characterised in 64 patients enrolled in clinical trials with trametinib who had mild hepatic impairment (defined by National Cancer Institute classification) using a population pharmacokinetic analysis. Trametinib oral clearance and thus exposure to trametinib was not significantly different in these patients relative to patients with normal hepatic function. No data are available in patients with moderate or severe hepatic impairment (see section 4.2).

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### *Renal Impairment*

Renal impairment is unlikely to have a clinically relevant effect on trametinib pharmacokinetics given the low renal excretion of trametinib. The pharmacokinetics of trametinib were characterised in 223 patients enrolled in clinical trials with trametinib who had mild renal impairment and 35 patients with moderate renal impairment using a population pharmacokinetic analysis. Mild and moderate renal impairment had no effect on trametinib exposure (<6% for either group). No data are available in patients with severe renal impairment (see section 4.2).

### *Patients ≥ 65 years of age*

Based on the population pharmacokinetics analysis, age had no relevant clinical effect on trametinib pharmacokinetics.

### *Paediatric population (< 18 years of age)*

No studies have been conducted to investigate the pharmacokinetics of trametinib in paediatric patients.

## 5.3 Preclinical Safety Data

### Genotoxicity

Trametinib was not genotoxic in studies evaluating reverse mutations in bacteria, chromosomal aberrations in mammalian cells and micronuclei in the bone marrow of rats.

### Carcinogenicity, Mutagenicity and Impairment of Fertility

#### *Carcinogenicity*

Carcinogenicity studies with MEKINIST have not been conducted. Trametinib was not genotoxic in studies evaluating reverse mutations in bacteria, chromosomal aberrations in mammalian cells and micronuclei in the bone marrow of rats.

## 6. PHARMACEUTICAL PARTICULARS

### 6.1 List of excipients

#### Mekinist 0.5 mg film-coated tablets

Mannitol, microcrystalline cellulose, hypromellose, croscarmellose sodium, magnesium stearate (vegetable source), sodium lauryl sulfate, colloidal anhydrous silica, titanium dioxide, polyethylene glycol, iron oxide yellow.

#### Mekinist 2 mg film-coated tablets

Mannitol, microcrystalline cellulose, hypromellose, croscarmellose sodium, magnesium stearate (vegetable source), sodium lauryl sulfate, colloidal anhydrous silica, titanium dioxide, polyethylene glycol, polysorbate 80 and iron oxide red.

### 6.2 Incompatibilities

Not applicable.

### 6.3 Shelf life

24 months (unopened bottle); 1 month (opened bottle when stored up to 30°C).

### 6.4 Special precautions for storage

Store at 2°C to 8°C (Refrigerate). Protect from light and moisture. Do not remove the desiccant. Store in original container. Keep the bottle tightly closed.

# NEW ZEALAND DATA SHEET

## MEKINIST® TABLETS

*trametinib dimethyl sulfoxide*

### 6.5 Nature and contents of container

MEKINIST tablets are supplied in high-density polyethylene (HDPE) bottles with child resistant polypropylene closures, containing 7\* or 30 tablets. The bottle contains a desiccant.

\*Not all pack sizes may be marketed.

### 6.6 Special precautions for disposal

Any unused product should not be disposed of in household waste or wastewater. Return it to a pharmacist for safe disposal.

## 7. MEDICINE SCHEDULE

Prescription Medicine

## 8. SPONSOR

### Novartis New Zealand Limited

PO Box 99102, Newmarket Auckland 1149 New Zealand

Telephone: 0800 354 335

Fax number: (09) 361 8181

E-mail: medinfo.phauno@novartis.com

## 9. DATE OF FIRST APPROVAL

The date of consent to distribute these medicines were published in the New Zealand Gazette on: 26 March 2015

## 10. DATE OF REVISION OF THE TEXT

17 September 2020

## SUMMARY TABLE OF CHANGES

Section changed	Summary of new information
4.8	Added sarcoidosis in the post-marketing undesirable effects for MEKINIST in combination with dabrafenib

Internal document code: mek180920iNZ based on Novartis CDS dated 14 September 2020
